

# Chapter 10

## Standard Costs and the Balanced Scorecard

### Solutions to Questions

**10-1** A quantity standard indicates how much of an input should be used to make a unit of output. A price standard indicates how much the input should cost.

**10-2** Ideal standards assume perfection and do not allow for any inefficiency. Thus, ideal standards are rarely, if ever, attained. Practical standards can be attained by employees working at a reasonable, though efficient pace and allow for normal breaks and work interruptions.

**10-3** Chronic inability to meet a standard is likely to be demoralizing and may result in decreased productivity.

**10-4** A budget is usually expressed in terms of total dollars, whereas a standard is expressed on a per unit basis. A standard might be viewed as the budgeted cost for one unit.

**10-5** A variance is the difference between what was planned or expected and what was actually accomplished. A standard cost system has at least two types of variances. A price variance focuses on the difference between standard and actual prices. A quantity variance is concerned with the difference between the standard quantity of input allowed for the actual output and the actual amount of the input used.

**10-6** Under management by exception, managers focus their attention on results that deviate from expectations. It is assumed that results that meet expectations do not require investigation.

**10-7** Separating an overall variance into a price variance and a quantity variance provides more information. Moreover, price and quantity variances are usually the responsibilities of different managers.

**10-8** The materials price variance is usually the responsibility of the purchasing manager. The materials quantity and labor efficiency variances are usually the responsibility of production managers and supervisors.

**10-9** The materials price variance can be computed either when materials are purchased or when they are placed into production. It is usually better to compute the variance when materials are purchased since that is when the purchasing manager, who has responsibility for this variance, has completed his or her work. In addition, recognizing the price variance when materials are purchased allows the company to carry its raw materials in the inventory accounts at standard cost, which greatly simplifies book-keeping.

**10-10** This combination of variances may indicate that inferior quality materials were purchased at a discounted price, but the low quality materials created production problems.

**10-11** If standards are used to find who to blame for problems, they can breed resentment and undermine morale. Standards should not be used to conduct witch-hunts, or as a means of finding someone to blame for problems.

**10-12** Several factors other than the contractual rate paid to workers can cause a labor rate variance. For example, skilled workers with high hourly rates of pay can be given duties that require little skill and that call for low hourly rates of pay, resulting in an unfavorable rate variance. Or unskilled or untrained workers can be assigned to tasks that should be filled by more skilled workers with higher rates of pay, resulting in a favorable rate variance. Unfavorable rate variances can also arise from overtime work at premium rates.

**10-13** If poor quality materials create production problems, a result could be excessive labor time and therefore an unfavorable labor efficiency variance. Poor quality materials would not ordinarily affect the labor rate variance.

**10-14** The variable overhead efficiency variance and the direct labor efficiency variance will always be favorable or unfavorable together if overhead is applied on the basis of direct labor-hours. Both variances are computed by comparing the number of direct labor-hours actually worked to the standard hours allowed. That is, in each case the formula is:

$$\text{Efficiency Variance} = \text{SR}(\text{AH} - \text{SH})$$

Only the "SR" part of the formula differs between the two variances.

**10-15** A statistical control chart is a graphical aid that helps workers identify variances that should be investigated. Upper and lower limits are set on the control chart. Any variances falling between those limits are considered to be normal. Any variances falling outside of those limits are considered abnormal and are investigated.

**10-16** If labor is a fixed cost and standards are tight, then the only way to generate favorable labor efficiency variances is for every workstation to produce at capacity. However, the output of the entire system is limited by the capacity of the bottleneck. If workstations before the bottleneck in the production process produce at capacity, the bottleneck will be unable to process all of the work in process. In general, if every workstation is attempting to produce at capacity, then work in process inventory will build up in front of the workstations with the least capacity.

**10-17** A company's balanced scorecard should be derived from and support its strategy. Since different companies have different strategies, their balanced scorecards should be different.

**10-18** The balanced scorecard is constructed to support the company's strategy, which is a theory about what actions will further the company's goals. Assuming that the company has financial goals, measures of financial performance must be included in the balanced scorecard as a check on the reality of the theory. If the internal business processes improve, but the financial outcomes do not improve, the theory may be flawed and the strategy should be changed.

**10-19** The difference between the delivery cycle time and the throughput time is the waiting period between when an order is received and when production on the order is started. The throughput time is made up of process time, inspection time, move time, and queue time. These four elements can be classified between value-added time (process time) and non-value-added time (inspection time, move time, and queue time).

**10-20** An MCE of less than 1 means that the production process includes non-value-added time. An MCE of 0.40, for example, means that 40% of throughput time consists of actual processing, and that the other 60% consists of moving, inspection, and other non-value-added activities.

**10-21** Formal entry tends to give variances more emphasis than off-the-record computations. And, the use of standard costs in the journals simplifies the bookkeeping process by allowing all inventories to be carried at standard, rather than actual, cost.

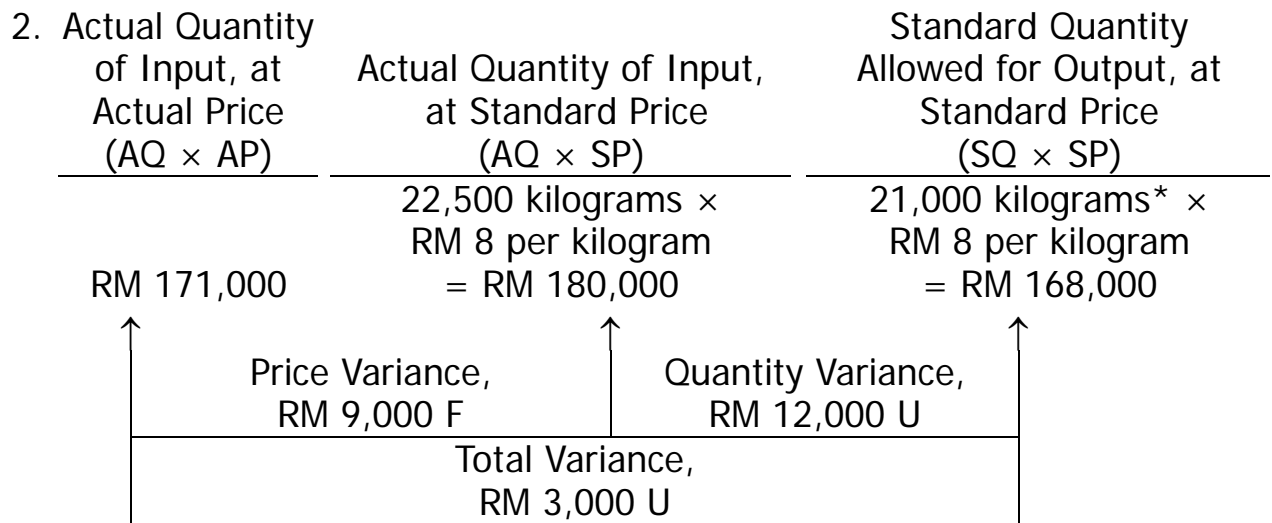

**Exercise 10-1** (20 minutes)

1. Cost per 15-gallon container .....	\$115.00
Less 2% cash discount .....	<u>2.30</u>
Net cost .....	112.70
Add shipping cost per container ( $\$130 \div 100$ ) .....	<u>1.30</u>
Total cost per 15-gallon container (a) .....	\$114.00
Number of quarts per container (15 gallons $\times$ 4 quarts per gallon) (b) .....	60
Standard cost per quart purchased (a) $\div$ (b) .....	<u>\$1.90</u>
2. Content per bill of materials .....	7.6 quarts
Add allowance for evaporation and spillage (7.6 quarts $\div$ 0.95 = 8.0 quarts; 8.0 quarts – 7.6 quarts = 0.4 quarts) .....	<u>0.4</u> quarts
Total .....	8.0 quarts
Add allowance for rejected units (8.0 quarts $\div$ 40 bottles) .....	<u>0.2</u> quarts
Standard quantity per salable bottle of solvent ...	<u>8.2</u> quarts

3.	<i>Standard</i>		<i>Standard Cost</i>
	<i>Item</i>	<i>Quantity</i>	<i>Standard Price</i>
	Echol	8.2 quarts	\$1.90 per quart
			<i>per Bottle</i>
			\$15.58

**Exercise 10-2** (20 minutes)

1. Number of helmets .....	35,000
Standard kilograms of plastic per helmet .....	<u>× 0.6</u>
Total standard kilograms allowed .....	21,000
Standard cost per kilogram .....	<u>× RM 8</u>
Total standard cost .....	<u>RM 168,000</u>
Actual cost incurred (given) .....	RM 171,000
Total standard cost (above) .....	<u>168,000</u>
Total material variance—unfavorable .....	<u>RM 3,000</u>

\*35,000 helmets × 0.6 kilograms per helmet = 21,000 kilograms

Alternatively:

Materials price variance = AQ (AP – SP)  
 22,500 kilograms (RM 7.60 per kilogram\* – RM 8.00 per kilogram)  
 = RM 9,000 F

\* RM 171,000 ÷ 22,500 kilograms = RM 7.60 per kilogram

Materials quantity variance = SP (AQ – SQ)  
 RM 8 per kilogram (22,500 kilograms – 21,000 kilograms)  
 = RM 12,000 U

**Exercise 10-3** (20 minutes)

1. Number of meals prepared .....	4,000	
Standard direct labor-hours per meal.....	<u>× 0.25</u>	
Total direct labor-hours allowed .....	1,000	
Standard direct labor cost per hour .....	<u>× \$9.75</u>	
Total standard direct labor cost.....	<u>\$9,750</u>	
Actual cost incurred.....	\$9,600	
Total standard direct labor cost (above)....	<u>9,750</u>	
Total direct labor variance .....	<u>\$ 150</u>	Favorable

2. Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
<hr/>	<hr/>	<hr/>
960 hours × \$10.00 per hour = \$9,600	960 hours × \$9.75 per hour = \$9,360	1,000 hours × \$9.75 per hour = \$9,750
↑	↑	↑
Rate Variance, \$240 U	Efficiency Variance, \$390 F	
<div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 0 auto;">                     Total Variance, \$150 F                 </div>		

Alternatively, the variances can be computed using the formulas:

$$\begin{aligned}
 \text{Labor rate variance} &= \text{AH}(\text{AR} - \text{SR}) \\
 &= 960 \text{ hours } (\$10.00 \text{ per hour} - \$9.75 \text{ per hour}) \\
 &= \$240 \text{ U}
 \end{aligned}$$

$$\begin{aligned}
 \text{Labor efficiency variance} &= \text{SR}(\text{AH} - \text{SH}) \\
 &= \$9.75 \text{ per hour } (960 \text{ hours} - 1,000 \text{ hours}) \\
 &= \$390 \text{ F}
 \end{aligned}$$

**Exercise 10-4** (20 minutes)

1. Number of items shipped.....	120,000
Standard direct labor-hours per item .....	<u>× 0.02</u>
Total direct labor-hours allowed .....	2,400
Standard variable overhead cost per hour .....	<u>× \$3.25</u>
Total standard variable overhead cost.....	<u>\$ 7,800</u>
Actual variable overhead cost incurred.....	\$7,360
Total standard variable overhead cost (above) ...	<u>7,800</u>
Total variable overhead variance .....	<u>\$ 440</u> Favorable

2. Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
<hr/>	<hr/>	<hr/>
2,300 hours × \$3.20 per hour* = \$7,360	2,300 hours × \$3.25 per hour = \$7,475	2,400 hours × \$3.25 per hour = \$7,800

\*\$7,360 ÷ 2,300 hours = \$3.20 per hour

Alternatively, the variances can be computed using the formulas:

Variable overhead spending variance:

$$AH(AR - SR) = 2,300 \text{ hours } (\$3.20 \text{ per hour} - \$3.25 \text{ per hour}) = \$115 \text{ F}$$

Variable overhead efficiency variance:

$$SR(AH - SH) = \$3.25 \text{ per hour } (2,300 \text{ hours} - 2,400 \text{ hours}) = \$325 \text{ F}$$

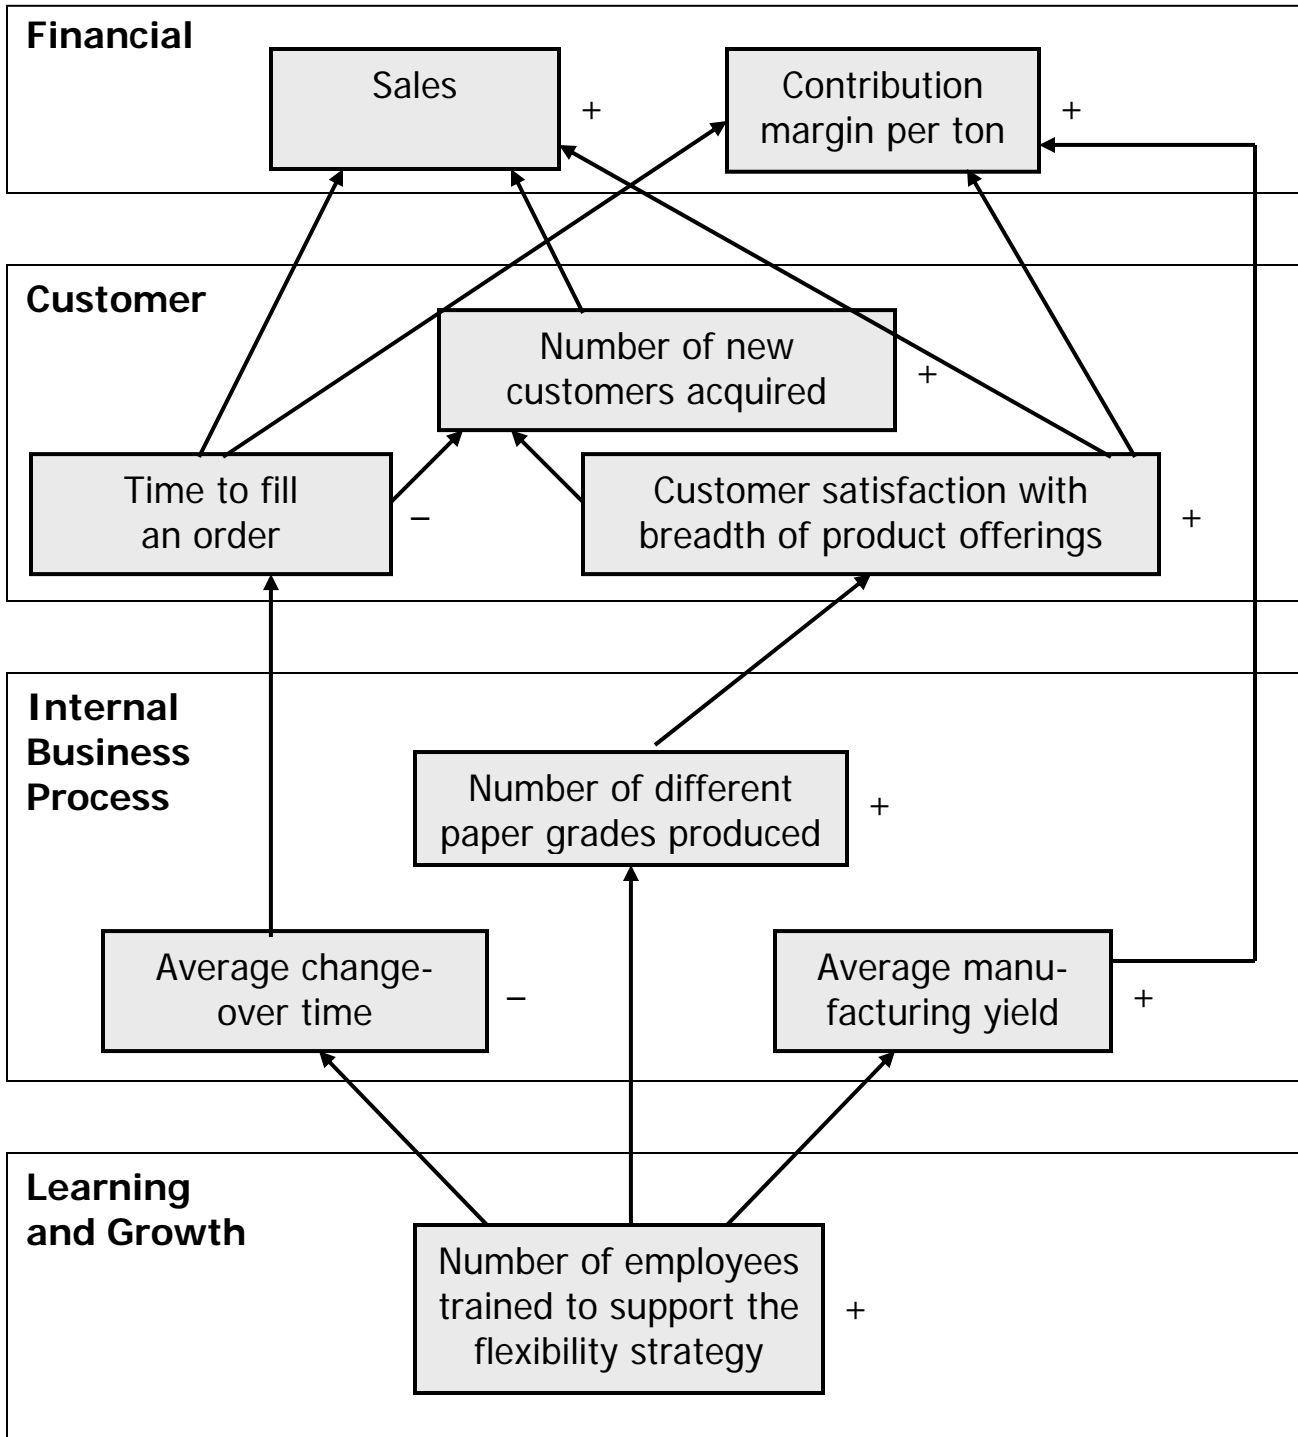

### Exercise 10-5 (45 minutes)

1. MPC's previous manufacturing strategy was focused on high-volume production of a limited range of paper grades. The goal of this strategy was to keep the machines running constantly to maximize the number of tons produced. Changeovers were avoided because they lowered equipment utilization. Maximizing tons produced and minimizing changeovers helped spread the high fixed costs of paper manufacturing across more units of output. The new manufacturing strategy is focused on low-volume production of a wide range of products. The goals of this strategy are to increase the number of paper grades manufactured, decrease changeover times, and increase yields across non-standard grades. While MPC realizes that its new strategy will decrease its equipment utilization, it will still strive to optimize the utilization of its high fixed cost resources within the confines of flexible production. In an economist's terms the old strategy focused on economies of scale while the new strategy focuses on economies of scope.
2. Employees focus on improving those measures that are used to evaluate their performance. Therefore, strategically-aligned performance measures will channel employee effort towards improving those aspects of performance that are most important to obtaining strategic objectives. If a company changes its strategy but continues to evaluate employee performance using measures that do not support the new strategy, it will be motivating its employees to make decisions that promote the old strategy, not the new strategy. And if employees make decisions that promote the new strategy, their performance measures will suffer.

Some performance measures that would be appropriate for MPC's old strategy include: equipment utilization percentage, number of tons of paper produced, and cost per ton produced. These performance measures would not support MPC's new strategy because they would discourage increasing the range of paper grades produced, increasing the number of changeovers performed, and decreasing the batch size produced per run.

**Exercise 10-5 (continued)**

3. Students' answers may differ in some details from this solution.

### Exercise 10-5 (continued)

4. The hypotheses underlying the balanced scorecard are indicated by the arrows in the diagram. Reading from the bottom of the balanced scorecard, the hypotheses are:
- If the number of employees trained to support the flexibility strategy increases, then the average changeover time will decrease and the number of different paper grades produced and the average manufacturing yield will increase.
  - If the average change-over time decreases, then the time to fill an order will decrease.
  - If the number of different paper grades produced increases, then the customer satisfaction with breadth of product offerings will increase.
  - If the average manufacturing yield increases, then the contribution margin per ton will increase.
  - If the time to fill an order decreases, then the number of new customers acquired, sales, and the contribution margin per ton will increase.
  - If the customer satisfaction with breadth of product offerings increases, then the number of new customers acquired, sales, and the contribution margin per ton will increase.
  - If the number of new customers acquired increases, then sales will increase.

Each of these hypotheses is questionable to some degree. For example, the time to fill an order is a function of additional factors above and beyond changeover times. Thus, MPC's average changeover time could decrease while its time to fill an order increases if, for example, the shipping department proves to be incapable of efficiently handling greater product diversity, smaller batch sizes, and more frequent shipments. The fact that each of the hypotheses mentioned above can be questioned does not invalidate the balanced scorecard. If the scorecard is used correctly, management will be able to identify which, if any, of the hypotheses are invalid and modify the balanced scorecard accordingly.

### Exercise 10-6 (20 minutes)

1. Throughput time = Process time + Inspection time + Move time + Queue time  
= 2.7 days + 0.3 days + 1.0 days + 5.0 days  
= 9.0 days

2. Only process time is value-added time; therefore the manufacturing cycle efficiency (MCE) is:

$$\text{MCE} = \frac{\text{Value-added time}}{\text{Throughput time}} = \frac{2.7 \text{ days}}{9.0 \text{ days}} = 0.30$$

3. If the MCE is 30%, then the complement of this figure, or 70% of the time, was spent in non-value-added activities.

4. Delivery cycle time = Wait time + Throughput time  
= 14.0 days + 9.0 days  
= 23.0 days

5. If all queue time in production is eliminated, then the throughput time drops to only 4 days (2.7 + 0.3 + 1.0). The MCE becomes:

$$\text{MCE} = \frac{\text{Value-added time}}{\text{Throughput time}} = \frac{2.7 \text{ days}}{4.0 \text{ days}} = 0.675$$

Thus, the MCE increases to 67.5%. This exercise shows quite dramatically how the JIT approach can improve the efficiency of operations and reduce throughput time.

**Exercise 10-7** (20 minutes)

1. The general ledger entry to record the purchase of materials for the month is:

Raw Materials		
(12,000 meters at \$3.25 per meter) .....	39,000	
Materials Price Variance		
(12,000 meters at \$0.10 per meter F) .....		1,200
Accounts Payable		
(12,000 meters at \$3.15 per meter) .....		37,800

2. The general ledger entry to record the use of materials for the month is:

Work in Process		
(10,000 meters at \$3.25 per meter) .....	32,500	
Materials Quantity Variance		
(500 meters at \$3.25 per meter U) .....		1,625
Raw Materials		
(10,500 meters at \$3.25 per meter) .....		34,125

3. The general ledger entry to record the incurrence of direct labor cost for the month is:

Work in Process (2,000 hours at \$12.00 per hour) ..	24,000	
Labor Rate Variance		
(1,975 hours at \$0.20 per hour U) .....		395
Labor Efficiency Variance		
(25 hours at \$12.00 per hour F) .....		300
Wages Payable		
(1,975 hours at \$12.20 per hour) .....		24,095

**Exercise 10-8** (20 minutes)

1. The standard price of a kilogram of white chocolate is determined as follows:

Purchase price, finest grade white chocolate .....	£7.50
Less purchase discount, 8% of the purchase price of £7.50 ...	(0.60)
Shipping cost from the supplier in Belgium .....	0.30
Receiving and handling cost .....	<u>0.04</u>
Standard price per kilogram of white chocolate .....	<u>£7.24</u>

2. The standard quantity, in kilograms, of white chocolate in a dozen truffles is computed as follows:

Material requirements .....	0.70
Allowance for waste .....	0.03
Allowance for rejects .....	<u>0.02</u>
Standard quantity of white chocolate .....	<u>0.75</u>

3. The standard cost of the white chocolate in a dozen truffles is determined as follows:

Standard quantity of white chocolate (a) .....	0.75 kilogram
Standard price of white chocolate (b) .....	<u>£7.24</u> per kilogram
Standard cost of white chocolate (a) × (b) ....	<u>£5.43</u>

**Exercise 10-9** (30 minutes)

1. a. Notice in the solution below that the materials price variance is computed on the entire amount of materials purchased, whereas the materials quantity variance is computed only on the amount of materials used in production.

Actual Quantity of Input, at Actual Price (AQ × AP)	Actual Quantity of Input, at Standard Price (AQ × SP)	Standard Quantity Allowed for Output, at Standard Price (SQ × SP)
25,000 microns × \$0.48 per micron = \$12,000	25,000 microns × \$0.50 per micron = \$12,500	18,000 microns* × \$0.50 per micron = \$9,000
<div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;"> <math>\uparrow</math> </div> <div style="text-align: center;"> <math>\uparrow</math> </div> <div style="text-align: center;"> <math>\uparrow</math> </div> </div> <div style="text-align: center; margin: 10px 0;">                     Price Variance, \$500 F  <math>20,000 \text{ microns} \times \\$0.50 \text{ per micron}</math>  <math>= \\$10,000</math> </div> <div style="text-align: center; margin: 10px 0;"> <math>\uparrow</math> </div> <div style="text-align: center; margin: 10px 0;">                     Quantity Variance, \$1,000 U                 </div>		

\*3,000 toys × 6 microns per toy = 18,000 microns

Alternatively:

Materials price variance = AQ (AP – SP)

25,000 microns (\$0.48 per micron – \$0.50 per micron) = \$500 F

Materials quantity variance = SP (AQ – SQ)

\$0.50 per micron (20,000 microns – 18,000 microns) = \$1,000 U

**Exercise 10-9** (continued)

b. Direct labor variances:

Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
\$36,000	4,000 hours × \$8.00 per hour = \$32,000	3,900 hours* × \$8.00 per hour = \$31,200
↑	↑	↑
<div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;">Rate Variance, \$4,000 U</div> <div style="text-align: center;">Efficiency Variance, \$800 U</div> </div> <div style="text-align: center; margin-top: 5px;">Total Variance, \$4,800 U</div>		

\*3,000 toys × 1.3 hours per toy = 3,900 hours

Alternatively:

Labor rate variance = AH (AR – SR)

4,000 hours (\$9.00 per hour\* – \$8.00 per hour) = \$4,000 U

\*\$36,000 ÷ 4,000 hours = \$9.00 per hour

Labor efficiency variance = SR (AH – SH)

\$8.00 per hour (4,000 hours – 3,900 hours) = \$800 U

## Exercise 10-9 (continued)

2. A variance usually has many possible explanations. In particular, we should always keep in mind that the standards themselves may be incorrect. Some of the other possible explanations for the variances observed at Dawson Toys appear below:

*Materials Price Variance* Since this variance is favorable, the actual price paid per unit for the material was less than the standard price. This could occur for a variety of reasons including the purchase of a lower grade material at a discount, buying in an unusually large quantity to take advantage of quantity discounts, a change in the market price of the material, or particularly sharp bargaining by the purchasing department.

*Materials Quantity Variance* Since this variance is unfavorable, more materials were used to produce the actual output than were called for by the standard. This could also occur for a variety of reasons. Some of the possibilities include poorly trained or supervised workers, improperly adjusted machines, and defective materials.

*Labor Rate Variance* Since this variance is unfavorable, the actual average wage rate was higher than the standard wage rate. Some of the possible explanations include an increase in wages that has not been reflected in the standards, unanticipated overtime, and a shift toward more highly paid workers.

*Labor Efficiency Variance* Since this variance is unfavorable, the actual number of labor hours was greater than the standard labor hours allowed for the actual output. As with the other variances, this variance could have been caused by any of a number of factors. Some of the possible explanations include poor supervision, poorly trained workers, low quality materials requiring more labor time to process, and machine breakdowns. In addition, if the direct labor force is essentially fixed, an unfavorable labor efficiency variance could be caused by a reduction in output due to decreased demand for the company's products.

It is worth noting that all of these variances could have been caused by the purchase of low quality materials at a cut-rate price.

**Exercise 10-10** (20 minutes)

1. If the total variance is \$93 unfavorable, and the rate variance is \$87 favorable, then the efficiency variance must be \$180 unfavorable, since the rate and efficiency variances taken together always equal the total variance. Knowing that the efficiency variance is \$180 unfavorable, one approach to the solution would be:

$$\begin{aligned}\text{Efficiency variance} &= \text{SR} (\text{AH} - \text{SH}) \\ \$9.00 \text{ per hour} (\text{AH} - 125 \text{ hours}^*) &= \$180 \text{ U} \\ \$9.00 \text{ per hour} \times \text{AH} - \$1,125 &= \$180^{**} \\ \$9.00 \text{ per hour} \times \text{AH} &= \$1,305 \\ \text{AH} &= \$1,305 \div \$9.00 \text{ per hour} \\ \text{AH} &= 145 \text{ hours}\end{aligned}$$

\*50 jobs  $\times$  2.5 hours per job = 125 hours

\*\*When used with the formula, unfavorable variances are positive and favorable variances are negative.

2. Rate variance = AH (AR – SR)  
145 hours (AR – \$9.00 per hour) = \$87 F  
145 hours  $\times$  AR – \$1,305 = –\$87\*  
145 hours  $\times$  AR = \$1,218  
AR = \$1,218  $\div$  145 hours  
AR = \$8.40 per hour

\*When used with the formula, unfavorable variances are positive and favorable variances are negative.

**Exercise 10-10 (continued)**

An alternative approach to each solution would be to work from known to unknown data in the columnar model for variance analysis:

Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
$145 \text{ hours} \times$ $\$8.40 \text{ per hour}$ $= \$1,218$	$145 \text{ hours} \times$ $\$9.00 \text{ per hour}^*$ $= \$1,305$	$125 \text{ hours}^{\$} \times$ $\$9.00 \text{ per hour}^*$ $= \$1,125$
↑	↑	↑
Rate Variance, \$87 F*		Efficiency Variance, \$180 U
Total Variance, \$93 U*		

<sup>\$</sup>50 tune-ups\* × 2.5 hours per tune-up\* = 125 hours

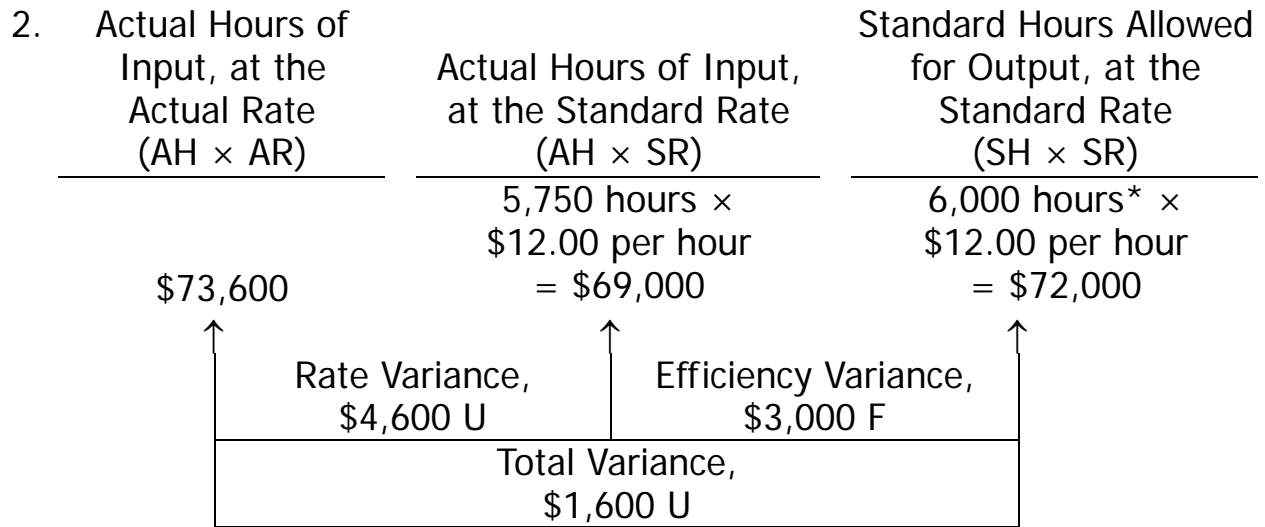

\*Given

**Exercise 10-11** (30 minutes)

1. Number of units manufactured .....	20,000
Standard labor time per unit .....	<u>× 0.3*</u>
Total standard hours of labor time allowed .....	6,000
Standard direct labor rate per hour .....	<u>× \$12</u>
Total standard direct labor cost .....	<u>\$72,000</u>

\*18 minutes ÷ 60 minutes per hour = 0.3 hours

Actual direct labor cost .....	\$73,600
Standard direct labor cost .....	<u>72,000</u>
Total variance—unfavorable .....	<u>\$ 1,600</u>

\*20,000 units × 0.3 hours per unit = 6,000 hours

Alternative Solution:

Labor rate variance = AH (AR – SR)  
 5,750 hours (\$12.80 per hour\* – \$12.00 per hour) = \$4,600 U  
 \*\$73,600 ÷ 5,750 hours = \$12.80 per hour  
 Labor efficiency variance = SR (AH – SH)  
 \$12.00 per hour (5,750 hours – 6,000 hours) = \$3,000 F

**Exercise 10-11** (continued)

3. Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
\$21,850	5,750 hours × \$4.00 per hour = \$23,000	6,000 hours × \$4.00 per hour = \$24,000
↑	↑	↑
Spending Variance, \$1,150 F		Efficiency Variance, \$1,000 F
Total Variance, \$2,150 F		

Alternative Solution:

$$\begin{aligned} \text{Variable overhead spending variance} &= \text{AH} (\text{AR} - \text{SR}) \\ 5,750 \text{ hours} (\$3.80 \text{ per hour}^* - \$4.00 \text{ per hour}) &= \$1,150 \text{ F} \end{aligned}$$

$$*\$21,850 \div 5,750 \text{ hours} = \$3.80 \text{ per hour}$$

$$\begin{aligned} \text{Variable overhead efficiency variance} &= \text{SR} (\text{AH} - \text{SH}) \\ \$4.00 \text{ per hour} (5,750 \text{ hours} - 6,000 \text{ hours}) &= \$1,000 \text{ F} \end{aligned}$$

**Exercise 10-12** (20 minutes)

1. Actual Quantity of Input, at Actual Price (AQ × AP)	Actual Quantity of Input, at Standard Price (AQ × SP)	Standard Quantity Allowed for Output, at Standard Price (SQ × SP)
$20,000 \text{ pounds} \times$ $\$2.35 \text{ per pound}$ $= \$47,000$	$20,000 \text{ pounds} \times$ $\$2.50 \text{ per pound}$ $= \$50,000$	$18,400 \text{ pounds}^* \times$ $\$2.50 \text{ per pound}$ $= \$46,000$
↑	↑	↑
Price Variance, \$3,000 F		Quantity Variance, \$4,000 U
Total Variance, \$1,000 U		

\*4,000 units × 4.6 pounds per unit = 18,400 pounds

Alternatively:

Materials price variance = AQ (AP – SP)

20,000 pounds (\$2.35 per pound – \$2.50 per pound) = \$3,000 F

Materials quantity variance = SP (AQ – SQ)

\$2.50 per pound (20,000 pounds – 18,400 pounds) = \$4,000 U

**Exercise 10-12 (continued)**

2. Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
\$10,425	750 hours × \$12.00 per hour = \$9,000	800 hours* × \$12.00 per hour = \$9,600
↑	↑	↑
Rate Variance, \$1,425 U		Efficiency Variance, \$600 F
Total Variance, \$825 U		

\*4,000 units × 0.2 hours per unit = 800 hours

Alternatively:

Labor rate variance = AH (AR – SR)

750 hours (\$13.90 per hour\* – \$12.00 per hour) = \$1,425 U

\*10,425 ÷ 750 hours = \$13.90 per hour

Labor efficiency variance = SR (AH – SH)

\$12.00 per hour (750 hours – 800 hours) = \$600 F

**Exercise 10-13** (15 minutes)

Notice in the solution below that the materials price variance is computed for the entire amount of materials purchased, whereas the materials quantity variance is computed only for the amount of materials used in production.

Actual Quantity of Input, at Actual Price (AQ × AP)	Actual Quantity of Input, at Standard Price (AQ × SP)	Standard Quantity Allowed for Output, at Standard Price (SQ × SP)
20,000 pounds × \$2.35 per pound = \$47,000	20,000 pounds × \$2.50 per pound = \$50,000	13,800 pounds* × \$2.50 per pound = \$34,500
↑	↑	↑
<div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;"> <p>Price Variance, \$3,000 F</p> </div> <div style="text-align: center;"> <p>14,750 pounds × \$2.50 per pound = \$36,875</p> </div> <div style="text-align: center;"> <p>Quantity Variance, \$2,375 U</p> </div> </div>		

\*3,000 units × 4.6 pounds per unit = 13,800 pounds

Alternatively:

Materials price variance = AQ (AP – SP)

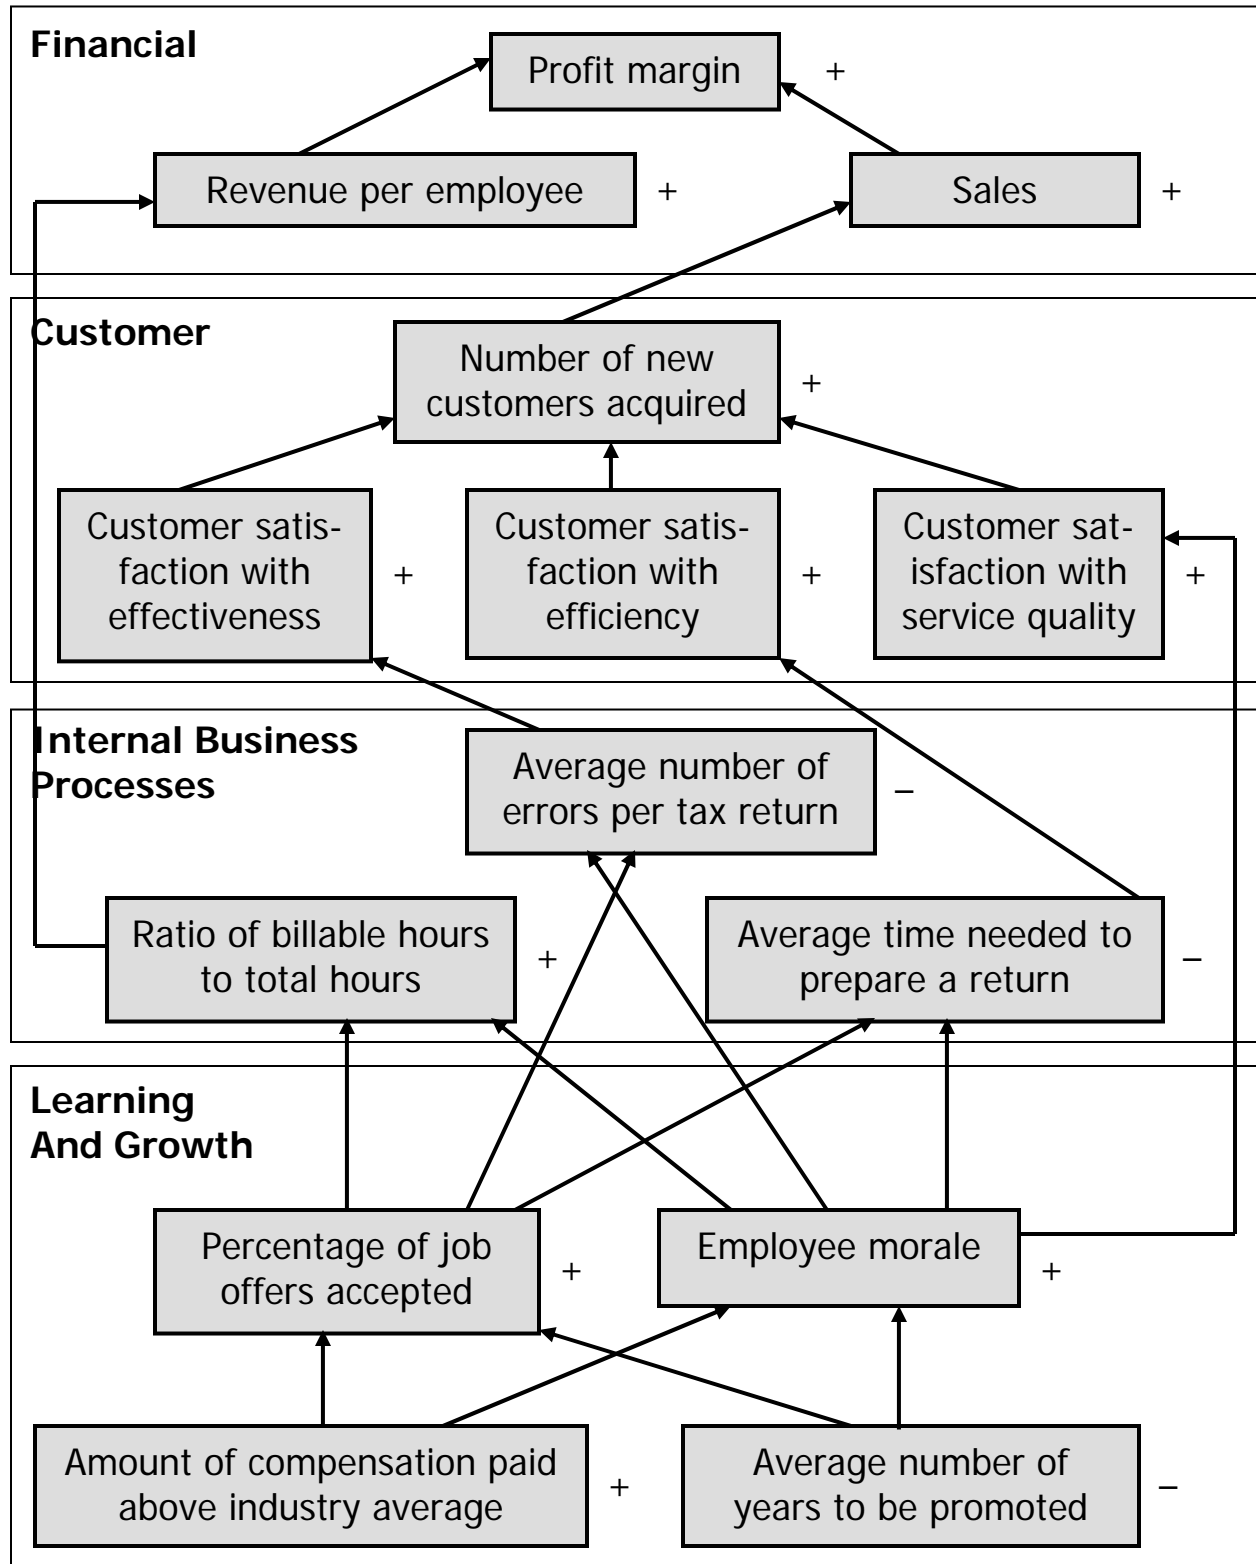

20,000 pounds (\$2.35 per pound – \$2.50 per pound) = \$3,000 F

Materials quantity variance = SP (AQ – SQ)

\$2.50 per pound (14,750 pounds – 13,800 pounds) = \$2,375 U

**Exercise 10-14** (45 minutes)

1. Students' answers may differ in some details from this solution.

### Exercise 10-14 (continued)

2. The hypotheses underlying the balanced scorecard are indicated by the arrows in the diagram. Reading from the bottom of the balanced scorecard, the hypotheses are:
- If the amount of compensation paid above the industry average increases, then the percentage of job offers accepted and the level of employee morale will increase.
  - If the average number of years to be promoted decreases, then the percentage of job offers accepted and the level of employee morale will increase.
  - If the percentage of job offers accepted increases, then the ratio of billable hours to total hours should increase while the average number of errors per tax return and the average time needed to prepare a return should decrease.
  - If employee morale increases, then the ratio of billable hours to total hours should increase while the average number of errors per tax return and the average time needed to prepare a return should decrease.
  - If employee morale increases, then the customer satisfaction with service quality should increase.
  - If the ratio of billable hours to total hours increases, then the revenue per employee should increase.
  - If the average number of errors per tax return decreases, then the customer satisfaction with effectiveness should increase.
  - If the average time needed to prepare a return decreases, then the customer satisfaction with efficiency should increase.
  - If the customer satisfaction with effectiveness, efficiency and service quality increases, then the number of new customers acquired should increase.
  - If the number of new customers acquired increases, then sales should increase.
  - If revenue per employee and sales increase, then the profit margin should increase.

## Exercise 10-14 (continued)

Each of these hypotheses is questionable to some degree. For example, Ariel's customers may define effectiveness as a function of minimizing their tax liability which is not necessarily the same as minimizing the number of errors in a tax return. If some of Ariel's customers became aware through a knowledgeable third party that Ariel overlooked legal tax minimizing opportunities, it is likely that the "customer satisfaction with effectiveness" measure would decline. This decline would probably puzzle Ariel because, although the firm prepared what it believed to be error-free returns, it overlooked important tax minimization strategies. In this example, Ariel's internal business process measure related to the average number of errors per tax return does not capture all of the factors that drive the customers' satisfaction with effectiveness. The fact that each of the hypotheses mentioned above can be questioned does not invalidate the balanced scorecard. If the scorecard is used correctly, management will be able to identify which, if any, of the hypotheses are invalid and then modify the balanced scorecard accordingly.

3. The performance measure "total dollar amount of tax refunds generated" would motivate Ariel's employees to aggressively search for tax minimization opportunities for its clients. However, employees may be too aggressive and recommend questionable or illegal tax practices to clients. This undesirable behavior could generate unfavorable publicity and lead to major problems for the company as well as its customers. Overall, it would probably be unwise to use this performance measure in Ariel's scorecard.

However, if Ariel wanted to create a scorecard measure to capture this aspect of its client service responsibilities, it may make sense to focus the performance measure on its training process. Properly trained employees are more likely to recognize viable tax minimization opportunities.

### **Exercise 10-14** (continued)

4. Each office's individual performance should be based on the scorecard measures only if the measures are controllable by those employed at the branch offices. In other words, it would not make sense to attempt to hold branch office managers responsible for measures such as the percent of job offers accepted or the amount of compensation paid above industry average. Recruiting and compensation decisions are not typically made at the branch offices. On the other hand, it would make sense to measure the branch offices with respect to internal business process, customer, and financial performance. Gathering this type of data would be useful for evaluating the performance of employees at each office.

**Exercise 10-15** (45 minutes)

1. a.

Actual Quantity of Input, at Actual Price (AQ × AP)	Actual Quantity of Input, at Standard Price (AQ × SP)	Standard Quantity Allowed for Output, at Standard Price (SQ × SP)
10,000 yards × \$13.80 per yard = \$138,000	10,000 yards × \$14.00 per yard = \$140,000	7,500 yards* × \$14.00 per yard = \$105,000
↑ Price Variance, \$2,000 F		↑
8,000 yards × \$14.00 per yard = \$112,000		↑
↑ Quantity Variance, \$7,000 U		↑

\*3,000 units × 2.5 yards per unit = 7,500 yards

Alternatively:

Materials price variance = AQ (AP – SP)

10,000 yards (\$13.80 per yard – \$14.00 per yard) = \$2,000 F

Materials quantity variance = SP (AQ – SQ)

\$14.00 per yard (8,000 yards – 7,500 yards) = \$7,000 U

**Exercise 10-15 (continued)**

b. The journal entries would be:

Raw Materials		
(10,000 yards × 14.00 per yard) .....	140,000	
Materials Price Variance		
(10,000 yards × \$0.20 per yard F) .....		2,000
Accounts Payable		
(10,000 yards × \$13.80 per yard) .....		138,000
 Work in Process		
(7,500 yards × \$14.00 per yard) .....	105,000	
Materials Quantity Variance		
(500 yards U × \$14.00 per yard) .....	7,000	
Raw Materials		
(8,000 yards × \$14.00 per yard) .....		112,000

2. a.

Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
\$43,000	5,000 hours × \$8.00 per hour = \$40,000	4,800 hours* × \$8.00 per hour = \$38,400
↑	↑	↑
Rate Variance, \$3,000 U	Efficiency Variance, \$1,600 U	
Total Variance, \$4,600 U		

\*3,000 units × 1.6 hours per unit = 4,800 hours

**Exercise 10-15 (continued)**

Alternative Solution:

Labor rate variance = AH (AR – SR)  
 5,000 hours (\$8.60 per hour\* – \$8.00 per hour) = \$3,000 U  
 \*\$43,000 ÷ 5,000 hours = \$8.60 per hour

Labor efficiency variance = SR (AH – SH)  
 \$8.00 per hour (5,000 hours – 4,800 hours) = \$1,600 U

b. The journal entry would be:

Work in Process		
(4,800 hours × \$8.00 per hour) .....	38,400	
Labor Rate Variance		
(5,000 hours × \$0.60 per hour U) .....	3,000	
Labor Efficiency Variance		
(200 hours U × \$8.00 per hour) .....	1,600	
Wages Payable		
(5,000 hours × \$8.60 per hour) .....		43,000

3. The entries are: entry (a), purchase of materials; entry (b), issue of materials to production; and entry (c), incurrence of direct labor cost.

Raw Materials	Work in Process
(a)    140,000      112,000    (b)	(b)    105,000
Bal.*    28,000	(c)    38,400
Accounts Payable	Wages Payable
138,000    (a)	43,000    (c)
Materials Price Variance	Materials Quantity Variance
2,000    (a)	(b)    7,000
Labor Rate Variance	Labor Efficiency Variance
(c)    3,000	(c)    1,600

\*2,000 yards of material at a standard cost of \$14.00 per yard

**Problem 10-16** (45 minutes)

1. The standard quantity of plates allowed for tests performed during the month would be:

Blood tests.....	1,800
Smears.....	<u>2,400</u>
Total.....	4,200
Plates per test.....	<u>× 2</u>
Standard quantity allowed.....	<u><u>8,400</u></u>

The variance analysis for plates would be:

Actual Quantity of Input, at Actual Price (AQ × AP)	Actual Quantity of Input, at Standard Price (AQ × SP)	Standard Quantity Allowed for Output, at Standard Price (SQ × SP)
\$28,200	12,000 plates × \$2.50 per plate = \$30,000	8,400 plates × \$2.50 per plate = \$21,000
	Price Variance, \$1,800 F 10,500 plates × \$2.50 per plate = \$26,250	
		Quantity Variance, \$5,250 U

Alternative Solution:

Materials price variance = AQ (AP – SP)  
 12,000 plates (\$2.35 per plate\* – \$2.50 per plate) = \$1,800 F

\*\$28,200 ÷ 12,000 plates = \$2.35 per plate.

Materials quantity variance = SP (AQ – SQ)  
 \$2.50 per plate (10,500 plates – 8,400 plates) = \$5,250 U

**Problem 10-16** (continued)

Note that all of the price variance is due to the hospital's 6% quantity discount. Also note that the \$5,250 quantity variance for the month is equal to 25% of the standard cost allowed for plates.

2. a. The standard hours allowed for tests performed during the month would be:

Blood tests: 0.3 hour per test × 1,800 tests .....	540 hours
Smears: 0.15 hour per test × 2,400 tests .....	<u>360</u> hours
Total standard hours allowed.....	<u>900</u> hours

The variance analysis would be:

Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
\$13,800	1,150 hours × \$14.00 per hour = \$16,100	900 hours × \$14.00 per hour = \$12,600
↑	↑	↑
Rate Variance, \$2,300 F		Efficiency Variance, \$3,500 U
Total Variance, \$1,200 U		

Alternative Solution:

$$\text{Labor rate variance} = \text{AH} (\text{AR} - \text{SR})$$

$$1,150 \text{ hours } (\$12.00 \text{ per hour}^* - \$14.00 \text{ per hour}) = \$2,300 \text{ F}$$

$$*\$13,800 \div 1,150 \text{ hours} = \$12.00 \text{ per hour}$$

$$\text{Labor efficiency variance} = \text{SR} (\text{AH} - \text{SH})$$

$$\$14.00 \text{ per hour } (1,150 \text{ hours} - 900 \text{ hours}) = \$3,500 \text{ U}$$

**Problem 10-16** (continued)

b. The policy probably should not be continued. Although the hospital is saving \$2 per hour by employing more assistants than senior technicians, this savings is more than offset by other factors. Too much time is being taken in performing lab tests, as indicated by the large unfavorable labor efficiency variance. And, it seems likely that most (or all) of the hospital's unfavorable quantity variance for plates is traceable to inadequate supervision of assistants in the lab.

3. The variable overhead variances follow:

Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
\$7,820	1,150 hours × \$6.00 per hour = \$6,900	900 hours × \$6.00 per hour = \$5,400
↑	↑	↑
Spending Variance, \$920 U	Efficiency Variance, \$1,500 U	
Total Variance, \$2,420 U		

Alternative Solution:

$$\begin{aligned} \text{Variable overhead spending variance} &= \text{AH} (\text{AR} - \text{SR}) \\ 1,150 \text{ hours} (\$6.80 \text{ per hour}^* - \$6.00 \text{ per hour}) &= \$920 \text{ U} \end{aligned}$$

$$*\$7,820 \div 1,150 \text{ hours} = \$6.80 \text{ per hour}$$

$$\begin{aligned} \text{Variable overhead efficiency variance} &= \text{SR} (\text{AH} - \text{SH}) \\ \$6.00 \text{ per hour} (1,150 \text{ hours} - 900 \text{ hours}) &= \$1,500 \text{ U} \end{aligned}$$

Yes, the two variances are closely related. Both are computed by comparing actual labor time to the standard hours allowed for the output of the period. Thus, if the labor efficiency variance is favorable (or unfavorable), then the variable overhead efficiency variance will also be favorable (or unfavorable).

**Problem 10-17** (45 minutes)

1. a. In the solution below, the materials price variance is computed on the entire amount of materials purchased whereas the materials quantity variance is computed only on the amount of materials used in production:

Actual Quantity of Input, at Actual Price (AQ × AP)	Actual Quantity of Input, at Standard Price (AQ × SP)	Standard Quantity Allowed for Output, at Standard Price (SQ × SP)
\$225,000	12,000 ounces × \$20.00 per ounce = \$240,000	9,375 ounces* × \$20.00 per ounce = \$187,500
↑	↑	↑
<div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;"> <p>Price Variance, \$15,000 F</p> <p>9,500 ounces × \$20.00 per ounce = \$190,000</p> </div> <div style="text-align: center;"> <p>Quantity Variance, \$2,500 U</p> </div> </div>		

\*3,750 units × 2.5 ounces per unit = 9,375 ounces

Alternatively:

Materials price variance = AQ (AP – SP)

12,000 ounces (\$18.75 per ounce\* – \$20.00 per ounce) = \$15,000 F

\*\$225,000 ÷ 12,000 ounces = \$18.75 per ounce

Materials quantity variance = SP (AQ – SQ)

\$20.00 per ounce (9,500 ounces – 9,375 ounces) = \$2,500 U

- b. Yes, the contract probably should be signed. The new price of \$18.75 per ounce is substantially lower than the old price of \$20.00 per ounce, resulting in a favorable price variance of \$15,000 for the month. Moreover, the material from the new supplier appears to cause little or no problem in production as shown by the small materials quantity variance for the month.

**Problem 10-17 (continued)**

2. a.

Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
5,600 hours* × \$12.00 per hour = \$67,200	5,600 hours × \$12.50 per hour = \$70,000	5,250 hours** × \$12.50 per hour = \$65,625
↑	↑	↑
Rate Variance, \$2,800 F		Efficiency Variance, \$4,375 U
Total Variance, \$1,575 U		

\* 35 technicians × 160 hours per technician = 5,600 hours

\*\* 3,750 units × 1.4 hours per technician = 5,250 hrs

Alternatively:

Labor rate variance = AH (AR – SR)

5,600 hours (\$12.00 per hour – \$12.50 per hour) = \$2,800 F

Labor efficiency variance = SR (AH – SH)

\$12.50 per hour (5,600 hours – 5,250 hours) = \$4,375 U

b. No, the new labor mix probably should not be continued. Although it decreases the average hourly labor cost from \$12.50 to \$12.00, thereby causing a \$2,800 favorable labor rate variance, this savings is more than offset by a large unfavorable labor efficiency variance for the month. Thus, the new labor mix increases overall labor costs.

**Problem 10-17 (continued)**

3. Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
\$18,200	5,600 hours* × \$3.50 per hour = \$19,600	5,250 hours** × \$3.50 per hour = \$18,375
↑	↑	↑
Spending Variance, \$1,400 F		Efficiency Variance, \$1,225 U
Total Variance, \$175 F		

\* Based on direct labor hours:

35 technicians × 160 hours per technician = 5,600 hours

\*\* 3,750 units × 1.4 hours per unit = 5,250 hours

Alternatively:

Variable overhead spending variance = AH (AR – SR)

5,600 hours (\$3.25 per hour\* – \$3.50 per hour) = \$1,400 F

\*\$18,200 ÷ 5,600 hours = \$3.25 per hour

Variable overhead efficiency variance = SR (AH – SH)

\$3.50 per hour (5,600 hours – 5,250 hours) = \$1,225 U

Both the labor efficiency variance and the variable overhead efficiency variance are computed by comparing actual labor-hours to standard labor-hours. Thus, if the labor efficiency variance is unfavorable, then the variable overhead efficiency variance will be unfavorable as well.

**Problem 10-18** (60 minutes)

1. a.

Actual Quantity of Input, at Actual Price (AQ × AP)	Actual Quantity of Input, at Standard Price (AQ × SP)	Standard Quantity Allowed for Output, at Standard Price (SQ × SP)
32,000 feet × \$4.80 per foot = \$153,600	32,000 feet × \$5.00 per foot = \$160,000	29,600 feet* × \$5.00 per foot = \$148,000
↑	↑	↑
Price Variance, \$6,400 F	Quantity Variance, \$12,000 U	
Total Variance, \$5,600 U		

\*8,000 footballs × 3.7 ft. per football = 29,600 feet

Alternative Solution:

Materials price variance = AQ (AP – SP)  
 32,000 feet (\$4.80 per foot – \$5.00 per foot) = \$6,400 F  
 Materials quantity variance = SP (AQ – SQ)  
 \$5.00 per foot (32,000 feet – 29,600 feet) = \$12,000 U

b. Raw Materials (32,000 feet × \$5.00 per foot) ...	160,000
Materials Price Variance (32,000 feet × \$0.20 per foot F) .....	6,400
Accounts Payable (32,000 feet × \$4.80 per foot) .....	153,600
Work in Process (29,600 feet × \$5.00 per foot).....	148,000
Materials Quantity Variance (2,400 feet U × \$5.00 per foot) .....	12,000
Raw Materials (32,000 feet × \$5.00 per foot) .....	160,000

**Problem 10-18 (continued)**

2. a.

Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
6,400 hours* × \$8.00 per hour = \$51,200	6,400 hours × \$7.50 per hour = \$48,000	7,200 hours** × \$7.50 per hour = \$54,000
↑	↑	↑
Rate Variance, \$3,200 U		Efficiency Variance, \$6,000 F
Total Variance, \$2,800 F		

\* 8,000 footballs × 0.8 hours per football = 6,400 hours

\*\* 8,000 footballs × 0.9 hours per football = 7,200 hours

Alternative Solution:

Labor rate variance = AH (AR – SR)

6,400 hours (\$8.00 per hour – \$7.50 per hour) = \$3,200 U

Labor efficiency variance = SR (AH – SH)

\$7.50 per hour (6,400 hours – 7,200 hours) = \$6,000 F

b. Work in Process (7,200 hours × \$7.50 per hour) ...	54,000
Labor Rate Variance	
(6,400 hours × \$0.50 per hour U) .....	3,200
Labor Efficiency Variance	
(800 hours F × \$7.50 per hour) .....	6,000
Wages Payable	
(6,400 hours × \$8.00 per hour) .....	51,200

**Problem 10-18** (continued)

3. Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
6,400 hours × \$2.75 per hour = \$17,600	6,400 hours × \$2.50 per hour = \$16,000	7,200 hours × \$2.50 per hour = \$18,000
↑	↑	↑
Spending Variance, \$1,600 U		Efficiency Variance, \$2,000 F
Total Variance, \$400 F		

Alternative Solution:

$$\begin{aligned} \text{Variable overhead spending variance} &= \text{AH} (\text{AR} - \text{SR}) \\ 6,400 \text{ hours} (\$2.75 \text{ per hour} - \$2.50 \text{ per hour}) &= \$1,600 \text{ U} \end{aligned}$$

$$\begin{aligned} \text{Variable overhead efficiency variance} &= \text{SR} (\text{AH} - \text{SH}) \\ \$2.50 \text{ per hour} (6,400 \text{ hours} - 7,200 \text{ hours}) &= \$2,000 \text{ F} \end{aligned}$$

4. No. He is not correct in his statement. The company has a large, unfavorable materials quantity variance that should be investigated. Also, the overhead spending variance equals 10% of standard, which should also be investigated.

It appears that the company's strategy to increase output by giving raises was effective. Although the raises resulted in an unfavorable rate variance, this variance was more than offset by a large, favorable efficiency variance.

## Problem 10-18 (continued)

5. The variances have many possible causes. Some of the more likely causes include the following:

### *Materials variances:*

Favorable price variance: Fortunate purchase, inferior quality materials, unusual discount due to quantity purchased, drop in market price, less costly method of freight, outdated or inaccurate standards.

Unfavorable quantity variance: Carelessness, poorly adjusted machines, unskilled workers, inferior quality materials, outdated or inaccurate standards.

### *Labor variances:*

Unfavorable rate variance: Use of highly skilled workers, change in pay scale, overtime, outdated or inaccurate standards.

Favorable efficiency variance: Use of highly skilled workers, high quality materials, new equipment, outdated or inaccurate standards.

### *Variable overhead variances:*

Unfavorable spending variance: Increase in costs, waste, theft, spillage, purchases in uneconomical lots, outdated or inaccurate standards.

Favorable efficiency variance: Same as for labor efficiency variance.

**Problem 10-19** (45 minutes)

1. a.

Actual Quantity of Input, at Actual Price (AQ × AP)	Actual Quantity of Input, at Standard Price (AQ × SP)	Standard Quantity Allowed for Output, at Standard Price (SQ × SP)
60,000 pounds × \$1.95 per pound = \$117,000	60,000 pounds × \$2.00 per pound = \$120,000	45,000 pounds* × \$2.00 per pound = \$90,000
↑	↑	↑
<div style="display: flex; justify-content: center; align-items: center; gap: 100px;"> <div style="text-align: center;"> <p>Price Variance, \$3,000 F</p> <hr style="width: 100%;"/> <p>49,200 pounds × \$2.00 per pound = \$98,400</p> </div> <div style="text-align: center;"> <p>Quantity Variance, \$8,400 U</p> </div> </div>		

\*15,000 pools × 3.0 pounds per pool = 45,000 pounds

Alternative Solution:

Materials price variance = AQ (AP – SP)

60,000 pounds (\$1.95 per pound – \$2.00 per pound) = \$3,000 F

Materials quantity variance = SP (AQ – SQ)

\$2.00 per pound (49,200 pounds – 45,000 pounds) = \$8,400 U

**Problem 10-19** (continued)

b.

Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
11,800 hours × \$7.00 per hour = \$82,600	11,800 hours × \$6.00 per hour = \$70,800	12,000 hours* × \$6.00 per hour = \$72,000
↑	↑	↑
Rate Variance, \$11,800 U		Efficiency Variance, \$1,200 F
Total Variance, \$10,600 U		

\*15,000 pools × 0.8 hours per pool = 12,000 hours

Alternative Solution:

Labor rate variance = AH (AR – SR)

11,800 hours (\$7.00 per hour – \$6.00 per hour) = \$11,800 U

Labor efficiency variance = SR (AH – SH)

\$6.00 per hour (11,800 hours – 12,000 hours) = \$1,200 F

**Problem 10-19** (continued)

c.

Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
\$18,290	5,900 hours × \$3.00 per hour = \$17,700	6,000 hours* × \$3.00 per hour = \$18,000
↑	↑	↑
Spending Variance, \$590 U		Efficiency Variance, \$300 F
Total Variance, \$290 U		

\*15,000 pools × 0.4 hours per pool = 6,000 hours

Alternative Solution:

Variable overhead spending variance = AH (AR – SR)  
5,900 hours (\$3.10 per hour\* – \$3.00 per hour) = \$590 U

\*\$18,290 ÷ 5,900 hours = \$3.10 per hour

Variable overhead efficiency variance = SR (AH – SH)  
\$3.00 per hour (5,900 hours – 6,000 hours) = \$300 F

**Problem 10-19** (continued)

2. Summary of variances:

Material price variance .....	\$ 3,000	F
Material quantity variance .....	8,400	U
Labor rate variance.....	11,800	U
Labor efficiency variance.....	1,200	F
Variable overhead spending variance .....	590	U
Variable overhead efficiency variance.....	<u>300</u>	F
Net variance .....	<u>\$16,290</u>	U

The net unfavorable variance of \$16,290 for the month caused the plant's variable cost of goods sold to increase from the budgeted level of \$180,000 to \$196,290:

Budgeted cost of goods sold at \$12 per pool .....	\$180,000
Add the net unfavorable variance, as above.....	<u>16,290</u>
Actual cost of goods sold .....	<u>\$196,290</u>

This \$16,290 net unfavorable variance also accounts for the difference between the budgeted net operating income and the actual net operating income for the month.

Budgeted net operating income .....	\$36,000
Deduct the net unfavorable variance added to cost of goods sold for the month.....	<u>16,290</u>
Net operating income .....	<u>\$19,710</u>

3. The two most significant variances are the materials quantity variance and the labor rate variance. Possible causes of the variances include:

Materials quantity variance: Outdated standards, unskilled workers, poorly adjusted machines, carelessness, poorly trained workers, inferior quality materials.

Labor rate variance: Outdated standards, change in pay scale, overtime pay.

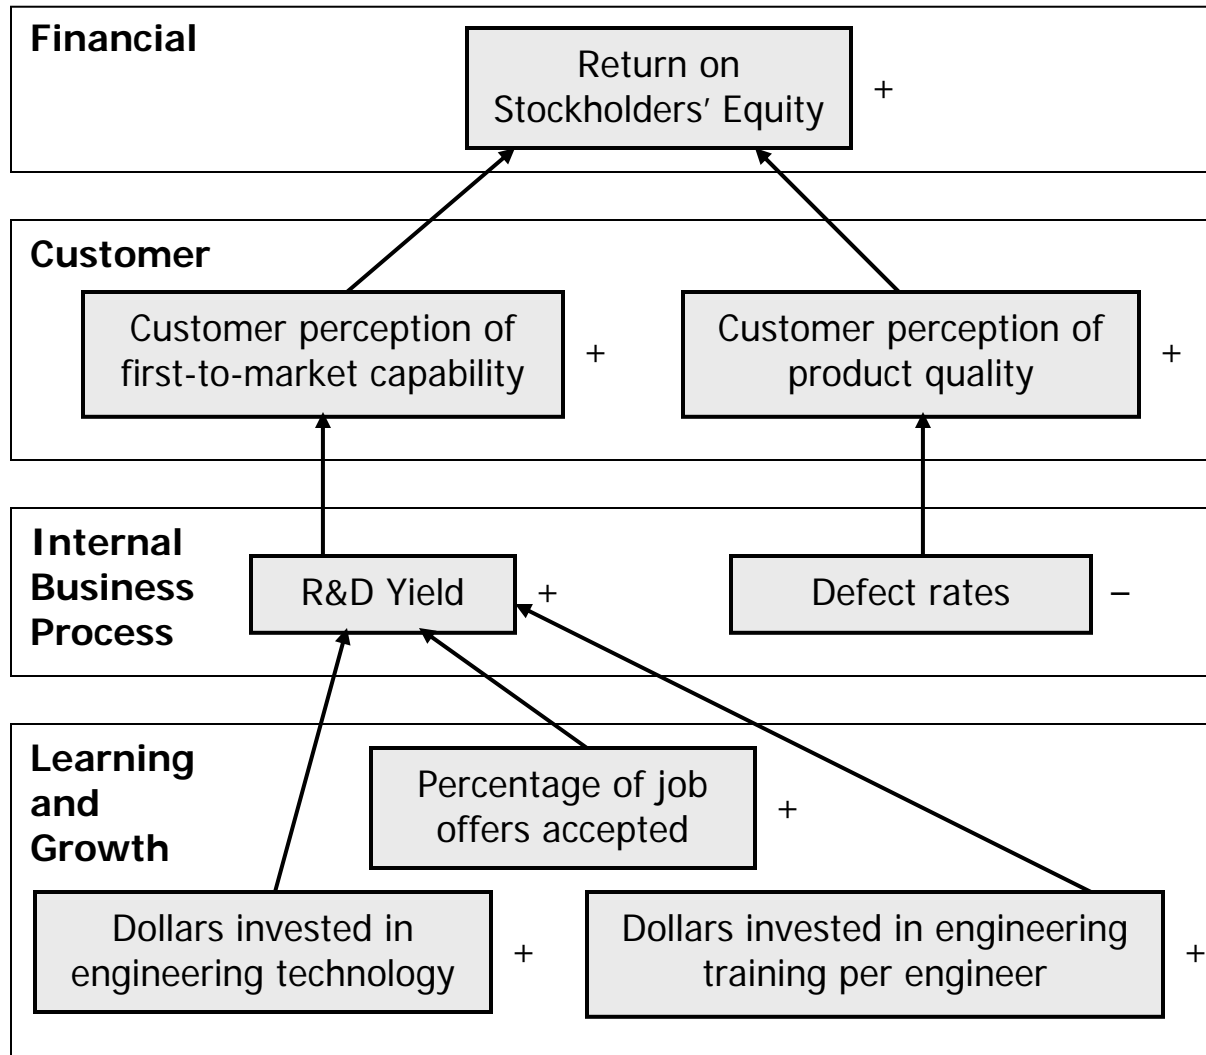

**Problem 10-20** (60 minutes)

1. Both companies view training as important; both companies need to leverage technology to succeed in the marketplace; and both companies are concerned with minimizing defects. There are numerous differences between the two companies. For example, Applied Pharmaceuticals is a product-focused company and Destination Resorts International (DRI) is a service-focused company. Applied Pharmaceuticals' training resources are focused on their engineers because they hold the key to the success of the organization. DRI's training resources are focused on their front-line employees because they hold the key to the success of their organization. Applied Pharmaceuticals' technology investments are focused on supporting the innovation that is inherent in the product development side of the business. DRI's technology investments are focused on supporting the day-to-day execution that is inherent in the customer interface side of the business. Applied Pharmaceuticals defines a defect from an internal manufacturing standpoint, while DRI defines a defect from an external customer interaction standpoint.

**Problem 10-20 (continued)**

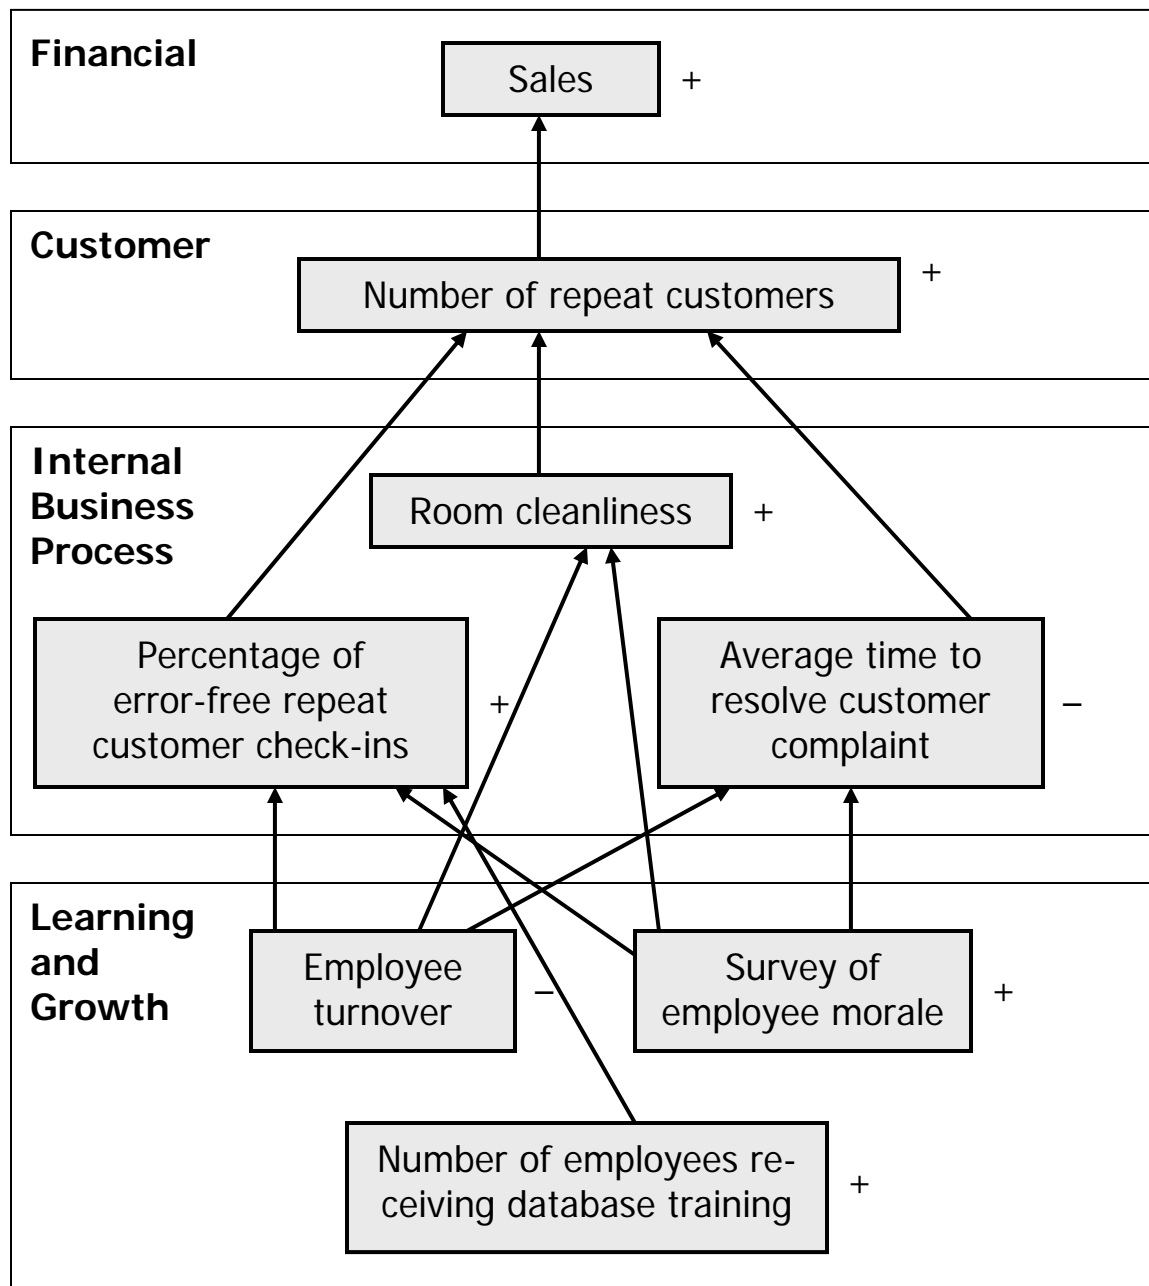

2. Students' answers may differ in some details from this solution.

**Applied Pharmaceuticals**

Problem 10-20 (continued)

Destination Resorts International

### **Problem 10-20 (continued)**

3. The hypotheses underlying the balanced scorecards are indicated by the arrows in each diagram. Reading from the bottom of each balanced scorecard, the hypotheses are:

#### **Applied Pharmaceuticals**

- If the dollars invested in engineering technology increase, then the R&D yield will increase.
- If the percentage of job offers accepted increases, then the R&D yield will increase.
- If the dollars invested in engineering training per engineer increase, then the R&D yield will increase.
- If the R&D yield increases, then customer perception of first-to-market capability will increase.
- If the defects per million opportunities decrease, then the customer perception of product quality will increase.
- If the customer perception of first-to-market capability increases, then the return on stockholders' equity will increase.
- If the customer perception of product quality increases, then the return on stockholders' equity will increase.

#### **Destination Resort International**

- If the employee turnover decreases, then the percentage of error-free repeat customer check-ins and room cleanliness will increase and the average time to resolve customer complaints will decrease.
- If the number of employees receiving database training increases, then the percentage of error-free repeat customer check-ins will increase.
- If employee morale increases, then the percentage of error-free repeat customer check-ins and room cleanliness will increase and the average time to resolve customer complaints will decrease.
- If the percentage of error-free repeat customer check-ins increases, then the number of repeat customers will increase.
- If the room cleanliness increases, then the number of repeat customers will increase.
- If the average time to resolve customer complaints decreases, then the number of repeat customers will increase.
- If the number of repeat customers increases, then sales will increase.

### **Problem 10-20** (continued)

Each of these hypotheses is questionable to some degree. For example, in the case of Applied Pharmaceuticals, R&D yield is not the sole driver of the customers' perception of first-to-market capability. More specifically, if Applied Pharmaceuticals experimented with nine possible drug compounds in year one and three of those compounds proved to be successful in the marketplace it would result in an R&D yield of 33%. If in year two, it experimented with four possible drug compounds and two of those compounds proved to be successful in the marketplace it would result in an R&D yield of 50%. While the R&D yield has increased from year one to year two, it is quite possible that the customer's perception of first-to-market capability would decrease. The fact that each of the hypotheses mentioned above can be questioned does not invalidate the balanced scorecard. If the scorecard is used correctly, management will be able to identify which, if any, of the hypotheses are invalid and the balanced scorecard can then be appropriately modified.

**Problem 10-21** (30 minutes)

1. a., b., and c.

	<i>Month</i>			
	<i>1</i>	<i>2</i>	<i>3</i>	<i>4</i>
Throughput time—days:				
Process time (x) .....	2.1	2.0	1.9	1.8
Inspection time.....	0.6	0.7	0.7	0.6
Move time .....	0.4	0.3	0.4	0.4
Queue time .....	<u>4.3</u>	<u>5.0</u>	<u>5.8</u>	<u>6.7</u>
Total throughput time (y) .....	<u>7.4</u>	<u>8.0</u>	<u>8.8</u>	<u>9.5</u>

Manufacturing cycle efficiency (MCE):

Process time (x) ÷				
Throughput time (y) .....	28.4%	25.0%	21.6%	18.9%

Delivery cycle time—days:

Wait time from order to start of				
production .....	16.0	17.5	19.0	20.5
Throughput time.....	<u>7.4</u>	<u>8.0</u>	<u>8.8</u>	<u>9.5</u>
Total delivery cycle time .....	<u>23.4</u>	<u>25.5</u>	<u>27.8</u>	<u>30.0</u>

2. All of the performance measures display unfavorable trends. Throughput time per unit is increasing—largely because of an increase in queue time. Manufacturing cycle efficiency is declining and delivery cycle time is increasing. In addition, the percentage of on-time deliveries has dropped as has the total throughput.

**Problem 10-21** (continued)

3. a. and b.

	<i>Month</i>	
	<u>5</u>	<u>6</u>
Throughput time—days:		
Process time (x) .....	1.8	1.8
Inspection time.....	0.6	0.0
Move time .....	0.4	0.4
Queue time .....	<u>0.0</u>	<u>0.0</u>
Total throughput time (y) .....	<u>2.8</u>	<u>2.2</u>
Manufacturing cycle efficiency (MCE):		
Process time (x) ÷ Throughput time (y).....	64.3%	81.8%

As a company reduces non-value-added activities, the manufacturing cycle efficiency increases rapidly. The goal, of course, is to have an efficiency of 100%. This will be achieved when *all* non-value-added activities have been eliminated and process time is equal to throughput time.

**Problem 10-22** (30 minutes)

1. Salex quantity standard:

Required per 10-liter batch ( $9.6 \text{ liters} \div 0.8$ ) .....	12.0 liters
Loss from rejected batches ( $1/5 \times 12 \text{ liters}$ ) .....	<u>2.4</u> liters
Total quantity per good batch .....	<u>14.4</u> liters

Nyclyn quantity standard:

Required per 10-liter batch ( $12 \text{ kilograms} \div 0.8$ ) ....	15.0 kilograms
Loss from rejected batches ( $1/5 \times 15 \text{ kilograms}$ )....	<u>3.0</u> kilograms
Total quantity per good batch .....	<u>18.0</u> kilograms

Protet quantity standard:

Required per 10-liter batch .....	5.0 kilograms
Loss from rejected batches ( $1/5 \times 5 \text{ kilograms}$ ) .....	<u>1.0</u> kilograms
Total quantity per good batch .....	<u>6.0</u> kilograms

2. Total minutes per 8-hour day .....	480 minutes
Less rest breaks and cleanup .....	<u>60</u> minutes
Productive time each day .....	<u>420</u> minutes

$$\frac{\text{Productive time each day}}{\text{Time required per batch}} = \frac{420 \text{ minutes per day}}{35 \text{ minutes per batch}} = 12 \text{ batches per day}$$

Time required per batch .....	35 minutes
Rest breaks and clean up time ( $60 \text{ minutes} \div 12 \text{ batches}$ ) .....	<u>5</u> minutes
Total .....	40 minutes
Loss from rejected batches ( $1/5 \times 40 \text{ minutes}$ ) .....	<u>8</u> minutes
Total time per good batch .....	<u>48</u> minutes

**Problem 10-22** (continued)

3. Standard cost card:

	<i>Standard Quantity or Time</i>	<i>Standard Price or Rate</i>	<i>Standard Cost</i>
Salex .....	14.4 liters	\$1.50 per liter	\$21.60
Nyclyn .....	18.0 kilograms	\$2.80 per kilogram	50.40
Protet .....	6.0 kilograms	\$3.00 per kilogram	18.00
Labor time .....	48 minutes, or 0.8 hour	\$9.00 per hour	<u>7.20</u>
Total standard cost per acceptable batch .....			<u><u>\$97.20</u></u>

**Problem 10-23** (45 minutes)

1. Materials price variance = (AQ × AP) – (AQ × SP)  
 (\$424,800) – (180,000 yards × \$2.40 per yard) = \$7,200 F

2. a. and b.

	<u>Lot Number</u>			<i>Total</i>
	<i>48</i>	<i>49</i>	<i>50</i>	
Standard yards:				
Units in lot (dozen) .....	1,500	950	2,100	4,550
Standard yards per dozen .....	<u>× 32</u>	<u>× 32</u>	<u>× 32</u>	<u>× 32</u>
Total yards allowed .....	48,000	30,400	67,200	145,600
Actual yards used .....	<u>48,300</u>	<u>30,140</u>	<u>67,250</u>	<u>145,690</u>
Quantity variance in yards .....	<u>300</u> U	<u>260</u> F	<u>50</u> U	<u>90</u> U
Quantity variance in dollars				
@ \$2.40 per yard .....	<u>\$720</u> U	<u>\$624</u> F	<u>\$120</u> U	<u>\$216</u> U

3. Labor rate variance = (AH × AR) – (AH × SR)  
 (\$192,280) – (25,300 hours\* × \$7.50 per hour) = \$2,530 U  
 \*8,900 hours + 6,130 hours + 10,270 hours = 25,300 hours

4. a. and b.

	<u>Lot Number</u>			<i>Total</i>
	<i>48</i>	<i>49</i>	<i>50</i>	
Standard hours: .....				
Units in lot (dozen) .....	1,500	950	2,100	4,550
Standard hours per dozen .....	<u>× 6</u>	<u>× 6</u>	<u>× 6</u>	<u>× 6</u>
Total standard hours .....	9,000	5,700	12,600	27,300
Percentage completed .....	<u>× 100%</u>	<u>× 100%</u>	<u>× 80%</u>	
Total standard hours allowed.....	9,000	5,700	10,080	24,780
Actual hours worked .....	<u>8,900</u>	<u>6,130</u>	<u>10,270</u>	<u>25,300</u>
Labor efficiency variance in hours .....	<u>100</u> F	<u>430</u> U	<u>190</u> U	<u>520</u> U
Labor efficiency variance in dollars @ \$7.50 per hour ...	<u>\$750</u> F	<u>\$3,225</u> U	<u>\$1,425</u> U	<u>\$3,900</u> U

### **Problem 10-23** (continued)

5. Some supervisors and managers rarely deal with, or think in terms of, dollars in their daily work. Instead they think in terms of hours, units, efficiency, and so on. For these managers, it may be better to express quantity variances in units (hours, yards, etc.) rather than in dollars. For other managers, quantity variances expressed in terms of dollars may be more useful—particularly to convey a notion of the materiality of the variance. In some cases, managers may prefer that the variances be expressed in terms of both dollars and units.

On the other hand, price variances expressed in units (hours, yards) would make little sense. Such variances should always be expressed in dollars.

**Problem 10-24** (45 minutes)

1. a. Materials quantity variance = SP (AQ – SQ)  
 \$5.00 per foot (AQ – 9,600 feet\*) = \$4,500 U  
 \$5.00 per foot × AQ – \$48,000 = \$4,500\*\*  
 \$5.00 per foot × AQ = \$52,500  
 AQ = 10,500 feet

\* \$3,200 units × 3 foot per unit

\*\* When used with the formula, unfavorable variances are positive and favorable variances are negative.

Therefore, \$55,650 ÷ 10,500 feet = \$5.30 per foot

- b. Materials price variance = AQ (AP – SP)  
 10,500 feet (\$5.30 per foot – \$5.00 per foot) = \$3,150 U

The total variance for materials would be:

Materials price variance.....	\$3,150 U
Materials quantity variance .....	<u>4,500 U</u>
Total variance.....	<u>\$7,650 U</u>

Alternative approach to parts (a) and (b):

Actual Quantity of Input, at Actual Price (AQ × AP)	Actual Quantity of Input, at Standard Price (AQ × SP)	Standard Quantity Allowed for Output, at Standard Price (SQ × SP)
10,500 feet × \$5.30 per foot = \$55,650*	10,500 feet × \$5.00 per foot* = \$52,500	9,600 feet** × \$5.00 per foot* = \$48,000
<div style="display: flex; justify-content: space-around; align-items: center; padding: 5px;"> <div style="text-align: left; width: 45%;">                     ↑ Price Variance, \$3,150 U                 </div> <div style="text-align: left; width: 45%;">                     ↑ Quantity Variance, \$4,500 U*                 </div> </div>	↑ Total Variance, \$7,650 U	

\* Given

\*\* 3,200 units × 3 foot per unit = 9,600 feet

**Problem 10-24 (continued)**

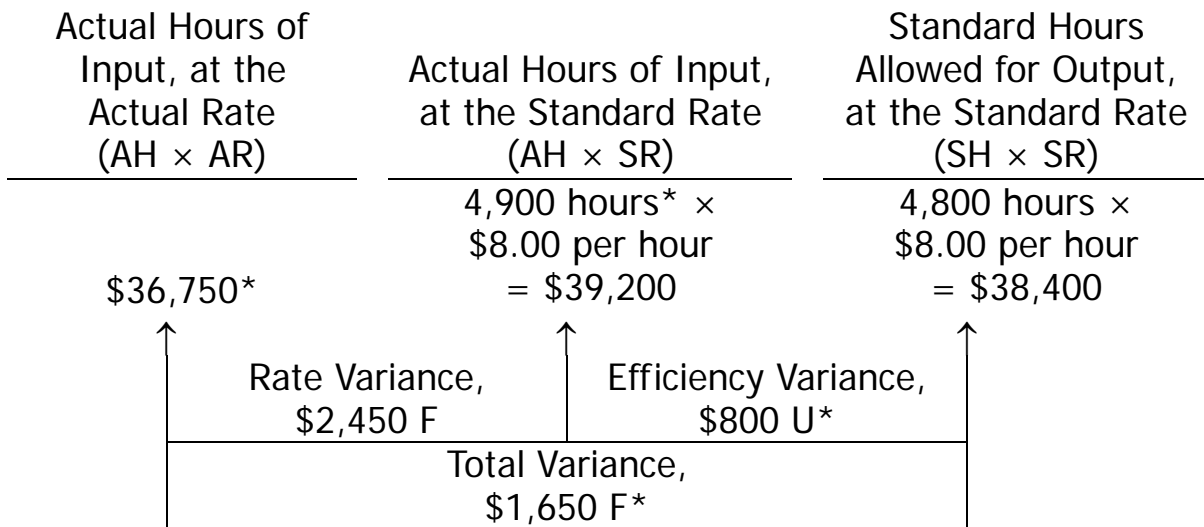

2. a. Labor rate variance = AH (AR – SR)  
 4,900 hours (\$7.50 per hour\* – SR) = \$2,450 F\*\*  
 \$36,750 – 4,900 hours × SR = -\$2,450\*\*\*  
 4,900 hours × SR = \$39,200  
 SR = \$8.00

\* \$36,750 ÷ 4,900 hours  
 \*\* \$1,650 F + \$800 U.  
 \*\*\* When used with the formula, unfavorable variances are positive and favorable variances are negative.

b. Labor efficiency variance = SR (AH – SH)  
 \$8 per hour (4,900 hours – SH) = \$800 U  
 \$39,200 – \$8 per hour × SH = \$800\*  
 \$8 per hour × SH = \$38,400  
 SH = 4,800 hours

\* When used with the formula, unfavorable variances are positive and favorable variances are negative.

Alternative approach to parts (a) and (b):

\*Given.

c. The standard hours allowed per unit of product would be:  
 4,800 hours ÷ 3,200 units = 1.5 hours per unit

**Problem 10-25** (75 minutes)

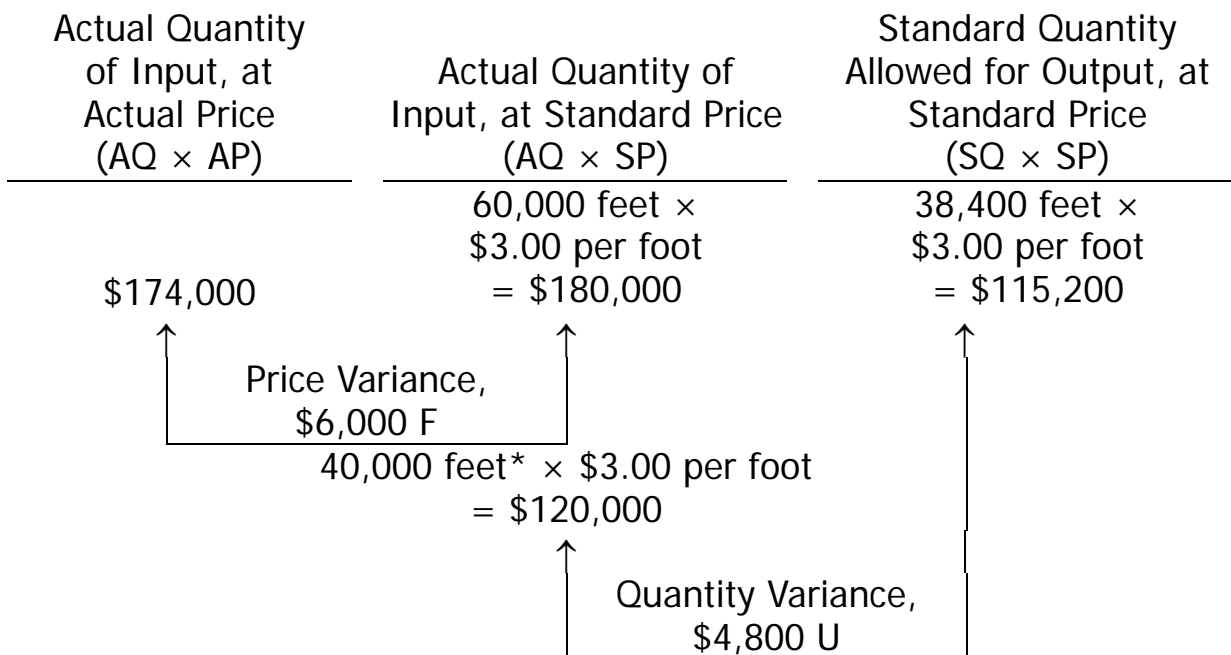

1. a. Before the variances can be computed, we must first compute the standard and actual quantities of material per hockey stick. The computations are:

Direct materials added to work in process (a) ... \$115,200  
 Standard direct materials cost per foot (b) ..... \$3.00  
 Standard quantity of direct materials (a) ÷ (b) .. 38,400 feet

Standard quantity of direct materials (a)..... 38,400 feet  
 Number of sticks produced (b)..... 8,000  
 Standard quantity per stick (a) ÷ (b)..... 4.8 feet

Actual quantity of direct materials used per stick last year:  
 4.8 feet + 0.2 feet = 5.0 feet.

With these figures, the variances can be computed as follows:

\*8,000 units × 5.0 feet per unit = 40,000 feet

**Problem 10-25 (continued)**

Alternative Solution:

$$\begin{aligned} \text{Materials price variance} &= \text{AQ} (\text{AP} - \text{SP}) \\ 60,000 \text{ feet} (\$2.90 \text{ per foot}^* - \$3.00 \text{ per foot}) &= \$6,000 \text{ F} \\ *\$174,000 \div 60,000 \text{ feet} &= \$2.90 \text{ per foot} \end{aligned}$$

$$\begin{aligned} \text{Materials quantity variance} &= \text{SP} (\text{AQ} - \text{SQ}) \\ \$3.00 \text{ per foot} (40,000 \text{ feet} - 38,400 \text{ feet}) &= \$4,800 \text{ U} \end{aligned}$$

b. Raw Materials (60,000 feet × \$3.00 per foot).....	180,000	
Materials Price Variance		
(60,000 feet × \$0.10 per foot F).....		6,000
Accounts Payable		
(60,000 feet × \$2.90 per foot) .....		174,000
Work in Process (38,400 feet × \$3.00 per foot) ....	115,200	
Materials Quantity Variance		
(1,600 feet U × \$3.00 per foot) .....	4,800	
Raw Materials (40,000 feet × \$3.00 per foot) ..		120,000

### Problem 10-25 (continued)

2. a. Before the variances can be computed, we must first determine the actual direct labor hours worked for last year. This can be done through the variable overhead efficiency variance, as follows:

$$\text{Variable overhead efficiency variance} = \text{SR} (\text{AH} - \text{SH})$$

$$\$1.30 \text{ per hour} \times (\text{AH} - 16,000 \text{ hours}^*) = \$650 \text{ U}$$

$$\$1.30 \text{ per hour} \times \text{AH} - \$20,800 = \$650^{**}$$

$$\$1.30 \text{ per hour} \times \text{AH} = \$21,450$$

$$\text{AH} = \$21,450 \div \$1.30 \text{ per hour}$$

$$\text{AH} = 16,500 \text{ hours}$$

\*  $8,000 \text{ units} \times 2.0 \text{ hours per unit} = 16,000 \text{ hours}$

\*\* When used in the formula, an unfavorable variance is positive.

We must also compute the standard rate per direct labor hour. The computation is:

$$\text{Labor rate variance} = (\text{AH} \times \text{AR}) - (\text{AH} \times \text{SR})$$

$$\$79,200 - (16,500 \text{ hours} \times \text{SR}) = \$3,300 \text{ F}$$

$$\$79,200 - 16,500 \text{ hours} \times \text{SR} = -\$3,300^*$$

$$16,500 \text{ hours} \times \text{SR} = \$82,500$$

$$\text{SR} = \$82,500 \div 16,500 \text{ hours}$$

$$\text{SR} = \$5.00 \text{ per hour}$$

\* When used in the formula, a favorable variance is negative.

**Problem 10-25 (continued)**

Given these figures, the variances are:

Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
\$79,200	16,500 hours × \$5.00 per hour = \$82,500	16,000 hours × \$5.00 per hour = \$80,000
↑	↑	↑
Rate Variance, \$3,300 F		Efficiency Variance, \$2,500 U
Total Variance, \$800 F		

Alternative Solution:

Labor rate variance = AH (AR – SR)  
 16,500 hours (\$4.80 per hour\* – \$5.00 per hour) = \$3,300 F

\*79,200 ÷ 16,500 hours = \$4.80 per hour

Labor efficiency variance = SR (AH – SH)  
 \$5.00 per hour (16,500 hours – 16,000 hours) = \$2,500 U

b. Work in Process

(16,000 hours × \$5.00 per hour) .....	80,000
Labor Efficiency Variance	
(500 hours U × \$5.00 per hour) .....	2,500
Labor Rate Variance	
(16,500 hours × \$0.20 per hour F) .....	3,300
Wages Payable	
(16,500 hours × \$4.80 per hour) .....	79,200

**Problem 10-25 (continued)**

3. Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
\$19,800	16,500 hours × \$1.30 per hour = \$21,450	16,000 hours × \$1.30 per hour = \$20,800
↑	↑	↑
Spending Variance, \$1,650 F	Efficiency Variance, \$650 U	
Total Variance, \$1,000 F		

Alternative Solution:

$$\begin{aligned} \text{Variable overhead spending variance} &= \text{AH} (\text{AR} - \text{SR}) \\ 16,500 \text{ hours} (\$1.20 \text{ per hour}^* - \$1.30 \text{ per hour}) &= \$1,650 \text{ F} \end{aligned}$$

$$*\$19,800 \div 16,500 \text{ hours} = \$1.20 \text{ per hour}$$

$$\begin{aligned} \text{Variable overhead efficiency variance} &= \text{SR} (\text{AH} - \text{SH}) \\ \$1.30 \text{ per hour} (16,500 \text{ hours} - 16,000 \text{ hours}) &= \$650 \text{ U} \end{aligned}$$

**Problem 10-25** (continued)

4. *For materials:*

Favorable price variance: Decrease in outside purchase price; fortunate buy; inferior quality materials; unusual discounts due to quantity purchased; less costly method of freight; inaccurate standards.

Unfavorable quantity variance: Inferior quality materials; carelessness; poorly adjusted machines; unskilled workers; inaccurate standards.

*For labor:*

Favorable rate variance: Unskilled workers (paid lower rates); piece-work; inaccurate standards.

Unfavorable efficiency variance: Poorly trained workers; poor quality materials; faulty equipment; work interruptions; fixed labor and insufficient demand to fill capacity; inaccurate standards.

*For variable overhead:*

Favorable spending variance: Decrease in supplier prices; less usage of lubricants or indirect materials than planned; inaccurate standards.

Unfavorable efficiency variance: See comments under direct labor efficiency variance above.

5.

	<i>Standard Quantity or Hours</i>	<i>Standard Price or Rate</i>	<i>Standard Cost</i>
Direct materials.....	4.8 feet	\$3.00 per foot	\$14.40
Direct labor.....	2.0 hours	\$5.00 per hour	10.00
Variable overhead.....	2.0 hours	\$1.30 per hour	<u>2.60</u>
Total standard cost .....			<u>\$27.00</u>

**Problem 10-26** (60 minutes)

1. Standard cost for March production:

Materials.....	\$16,800
Direct labor.....	10,500
Variable manufacturing overhead.....	<u>4,200</u>
Total standard cost (a) .....	<u>\$31,500</u>
Number of backpacks produced (b).....	1,000
Standard cost of a single backpack (a) ÷ (b).....	\$31.50

2. Standard cost of a single backpack (above) .....	\$31.50
Deduct difference between standard and actual cost.....	<u>0.15</u>
Actual cost per backpack .....	<u>\$31.35</u>

3. Total standard cost of materials used during March (a) ....	\$16,800
Number of backpacks produced during March (b).....	1,000
Standard materials cost per backpack (a) ÷ (b) .....	\$16.80

$$\frac{\text{Standard materials cost per backpack}}{\text{Standard materials cost per yard}} = \frac{\$16.80 \text{ per backpack}}{\$6.00 \text{ per yard}}$$

$$= 2.8 \text{ yards per backpack}$$

4. Standard cost of material used .....	\$16,800
Actual cost of material used .....	<u>15,000</u>
Total variance .....	<u>\$ 1,800 F</u>

The price and quantity variances together equal the total variance. If the quantity variance is \$1,200 U, then the price variance must be \$3,000 F:

Price variance .....	\$ 3,000 F
Quantity variance .....	<u>1,200 U</u>
Total variance .....	<u>\$ 1,800 F</u>

**Problem 10-26** (continued)

Alternative Solution:

Actual Quantity of Input, at Actual Price (AQ × AP)	Actual Quantity of Input, at Standard Price (AQ × SP)	Standard Quantity Allowed for Output, at Standard Price (SQ × SP)
3,000 yards × \$5.00 per yard = \$15,000*	3,000 yards × \$6.00 per yard* = \$18,000	2,800 yards** × \$6.00 per yard* = \$16,800*
↑	↑	↑
Price Variance, \$3,000 F		Quantity Variance, \$1,200 U*
Total Variance, \$1,800 F		

\* Given.

\*\* 1,000 units × 2.8 yards per unit = 2,800 yards

5. The first step in computing the standard direct labor rate is to determine the standard direct labor-hours allowed for the month's production. The standard direct labor-hours can be computed by working with the variable manufacturing overhead costs, since they are based on direct labor-hours worked:

Standard variable manufacturing overhead cost for March (a) ...	\$4,200
Standard variable manufacturing overhead rate per direct labor-hour (b).....	<u>\$3.00</u>
Standard direct labor-hours for March (a) ÷ (b).....	<u><u>1,400</u></u>

$$\frac{\text{Total standard direct labor cost for March}}{\text{Total standard direct labor-hours for March}} = \frac{\$10,500}{1,400 \text{ DLHs}} = \$7.50 \text{ per DLH}$$

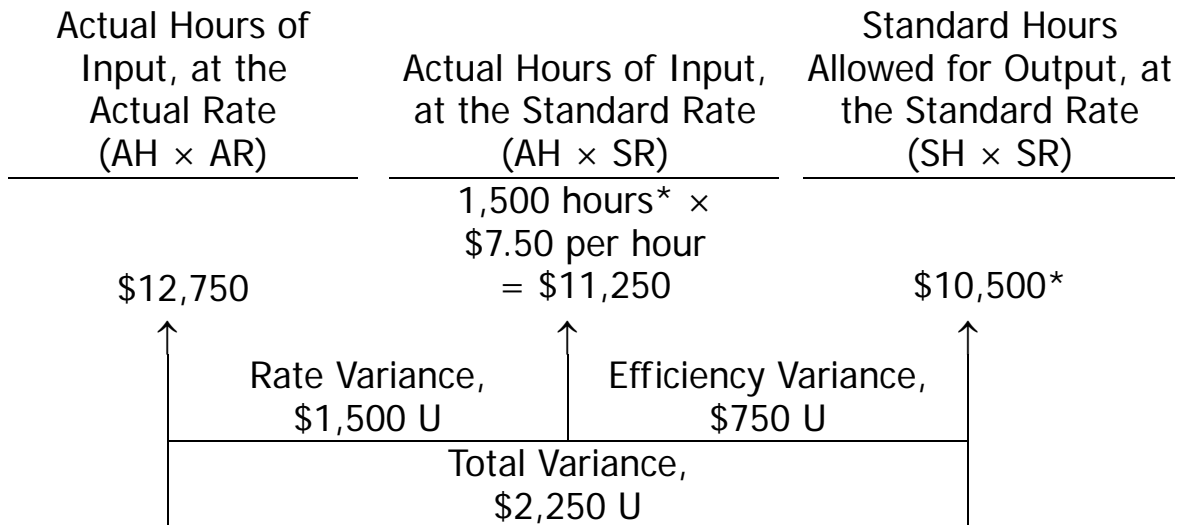

**Problem 10-26** (continued)

6. Before the labor variances can be computed, it is necessary to compute the actual direct labor cost for the month:

Actual cost per backpack produced (part 2) .....		\$ 31.35
Number of backpacks produced.....		<u>× 1,000</u>
Total actual cost of production.....		\$31,350
Less: Actual cost of materials .....	\$15,000	
Actual cost of variable manufacturing overhead .....	<u>3,600</u>	<u>18,600</u>
Actual cost of direct labor .....		<u>\$12,750</u>

With this information, the variances can be computed:

\*Given.

**Problem 10-26** (continued)

7. Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
\$3,600*	1,500 hours* × \$3.00 per hour* = \$4,500	\$4,200*
↑	↑	↑
Spending Variance, \$900 F	Efficiency Variance, \$300 U	
Total Variance, \$600 F		

\*Given.

	<i>Standard</i>	<i>Standard</i>	<i>Standard</i>
	<i>Quantity or</i>	<i>Price or</i>	<i>Cost</i>
	<i>Hours</i>	<i>Rate</i>	
Direct materials.....	2.8 yards <sup>1</sup>	\$6 per yard	\$16.80
Direct labor.....	1.4 hours <sup>2</sup>	\$7.50 per hour <sup>3</sup>	10.50
Variable manufacturing overhead .....	1.4 hours	\$3 per hour	<u>4.20</u>
Total standard cost.....			<u>\$31.50</u>

<sup>1</sup>From part 3.

<sup>2</sup>1,400 standard hours (from part 5) ÷ 1,000 backpacks = 1.4 hours per backpack.

<sup>3</sup>From part 5.

**Problem 10-27** (75 minutes)

Actual Quantity of Input, at Actual Price (AQ × AP)	Actual Quantity of Input, at Standard Price (AQ × SP)	Standard Quantity Allowed for Output, at Standard Price (SQ × SP)
510,000 feet × \$3.20 per foot = \$1,632,000	510,000 feet × \$3.00 per foot = \$1,530,000	540,000 feet* × \$3.00 per foot = \$1,620,000
↑	↑	↑
Price Variance, \$102,000 U		Quantity Variance, \$90,000 F
Total Variance, \$12,000 U		

\*30,000 units × 18 feet per unit = 540,000 feet

Alternative Solution:

Materials price variance = AQ (AP – SP)  
 510,000 feet (\$3.20 per foot – \$3.00 per foot) = \$102,000 U

Materials quantity variance = SP (AQ – SQ)  
 \$3 per foot (510,000 feet – 540,000 feet) = \$90,000 F

Yes, the decrease in waste is apparent because of the \$90,000 favorable quantity variance.

If the company wants to continue to compute the material price variance, then the standard price per foot should be changed to reflect current JIT purchase costs. The old standard price of \$3.00 per foot is no longer relevant.

**Problem 10-27 (continued)**

2. Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
$90,000 \text{ hours} \times$ $\$7.85 \text{ per hour}$ $= \$706,500$	$90,000 \text{ hours} \times$ $\$8.00 \text{ per hour}$ $= \$720,000$	$75,000 \text{ hours}^* \times$ $\$8.00 \text{ per hour}$ $= \$600,000$
↑	↑	↑
Rate Variance, \$13,500 F		Efficiency Variance, \$120,000 U
Total Variance, \$106,500 U		

\*30,000 units × 2.5 hours per unit = 75,000 hours

**Alternative Solution:**

Labor rate variance = AH (AR – SR)

90,000 hours (\$7.85 per hour – \$8.00 per hour) = \$13,500 F

Labor efficiency variance = SR (AH – SH)

\$8.00 per hour (90,000 hours – 75,000 hours) = \$120,000 U

### Problem 10-27 (continued)

No, the labor efficiency variance is not appropriate as a measure of performance in this situation. The reasons are:

- Labor is largely a fixed cost rather than a variable cost since the company maintains a stable workforce to operate its flow line. Thus, the variance is not an effective measure of efficiency.
- In a JIT environment the goal is to produce only as needed to meet demand. This often conflicts with the goal of having high labor efficiency, which requires that labor be fully utilized producing output. If that output is not really demanded by customers, the result of fully utilizing labor is a buildup of excess work in process and finished goods inventories. This is anathema in a JIT environment. Unfortunately, the situation posed in the problem is a common one as companies switch from a traditional system to JIT, and sometimes JIT doesn't work because of misplaced emphasis on efficiency variances. In a JIT setting, it is an interesting paradox that one of the "costs" of greater efficiency on the production line is greater "inefficiency" on the part of labor as it is occasionally idle or as it spends time at various tasks other than producing goods.

**Problem 10-27** (continued)

3. Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
$\$207,000$	$90,000 \text{ hours} \times$ $\$2.80 \text{ per hour}$ $= \$252,000$	$75,000 \text{ hours}^* \times$ $\$2.80 \text{ per hour}$ $= \$210,000$
<div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;"> <math>\uparrow</math>            Spending Variance,  <math>\\$45,000 \text{ F}</math> </div> <div style="text-align: center;"> <math>\uparrow</math>            Efficiency Variance,  <math>\\$42,000 \text{ U}</math> </div> </div> <div style="border: 1px solid black; width: 100%; height: 20px; margin-top: 5px; text-align: center; padding: 2px;">             Total Variance,  <math>\\$3,000 \text{ F}</math> </div>		

\*30,000 units × 2.5 hours per unit = 75,000 hours

**Alternative Solution:**

$$\begin{aligned} \text{Variable overhead spending variance} &= \text{AH} \times \text{AR} - \text{AH} \times \text{SR} \\ \$207,000 - 90,000 \text{ hours} \times \$2.80 \text{ per hour} &= \$45,000 \text{ F} \end{aligned}$$

$$\begin{aligned} \text{Variable overhead efficiency variance} &= \text{SR} (\text{AH} - \text{SH}) \\ \$2.80 \text{ per hour} (90,000 \text{ hours} - 75,000 \text{ hours}) &= \$42,000 \text{ U} \end{aligned}$$

It is doubtful that a correlation still exists between direct labor and variable manufacturing overhead cost. Direct labor time is now largely a fixed cost. Variable manufacturing overhead, however, will tend to rise and fall with actual changes in production. If variable manufacturing overhead cost was indeed correlated with direct labor, then the actual variable manufacturing overhead cost for June should have been about \$252,000 (90,000 hours × \$2.80 per hour). But actual variable manufacturing overhead cost was far below this figure, as shown by the large favorable spending variance for the month. Indeed, the actual variable manufacturing overhead cost of \$207,000 is very near the \$210,000 standard cost allowed for the month's output. Thus, it appears that as production has been cut back, variable manufacturing overhead cost has also decreased, even though direct labor time has remained quite stable.

**Problem 10-27** (continued)

4. a. and b.

	<i>Month</i>		
	<i>April</i>	<i>May</i>	<i>June</i>
Throughput time—hours:			
Processing time (x) .....	2.6	2.5	2.4
Inspection time.....	1.3	0.9	0.1
Move time .....	1.9	1.4	0.6
Queue time .....	<u>8.2</u>	<u>5.2</u>	<u>1.9</u>
Total throughput time (y) .....	<u>14.0</u>	<u>10.0</u>	<u>5.0</u>

Manufacturing cycle efficiency (MCE):

Processing time (x) ÷ Throughput time (y) .. 18.6% 25.0% 48.0%

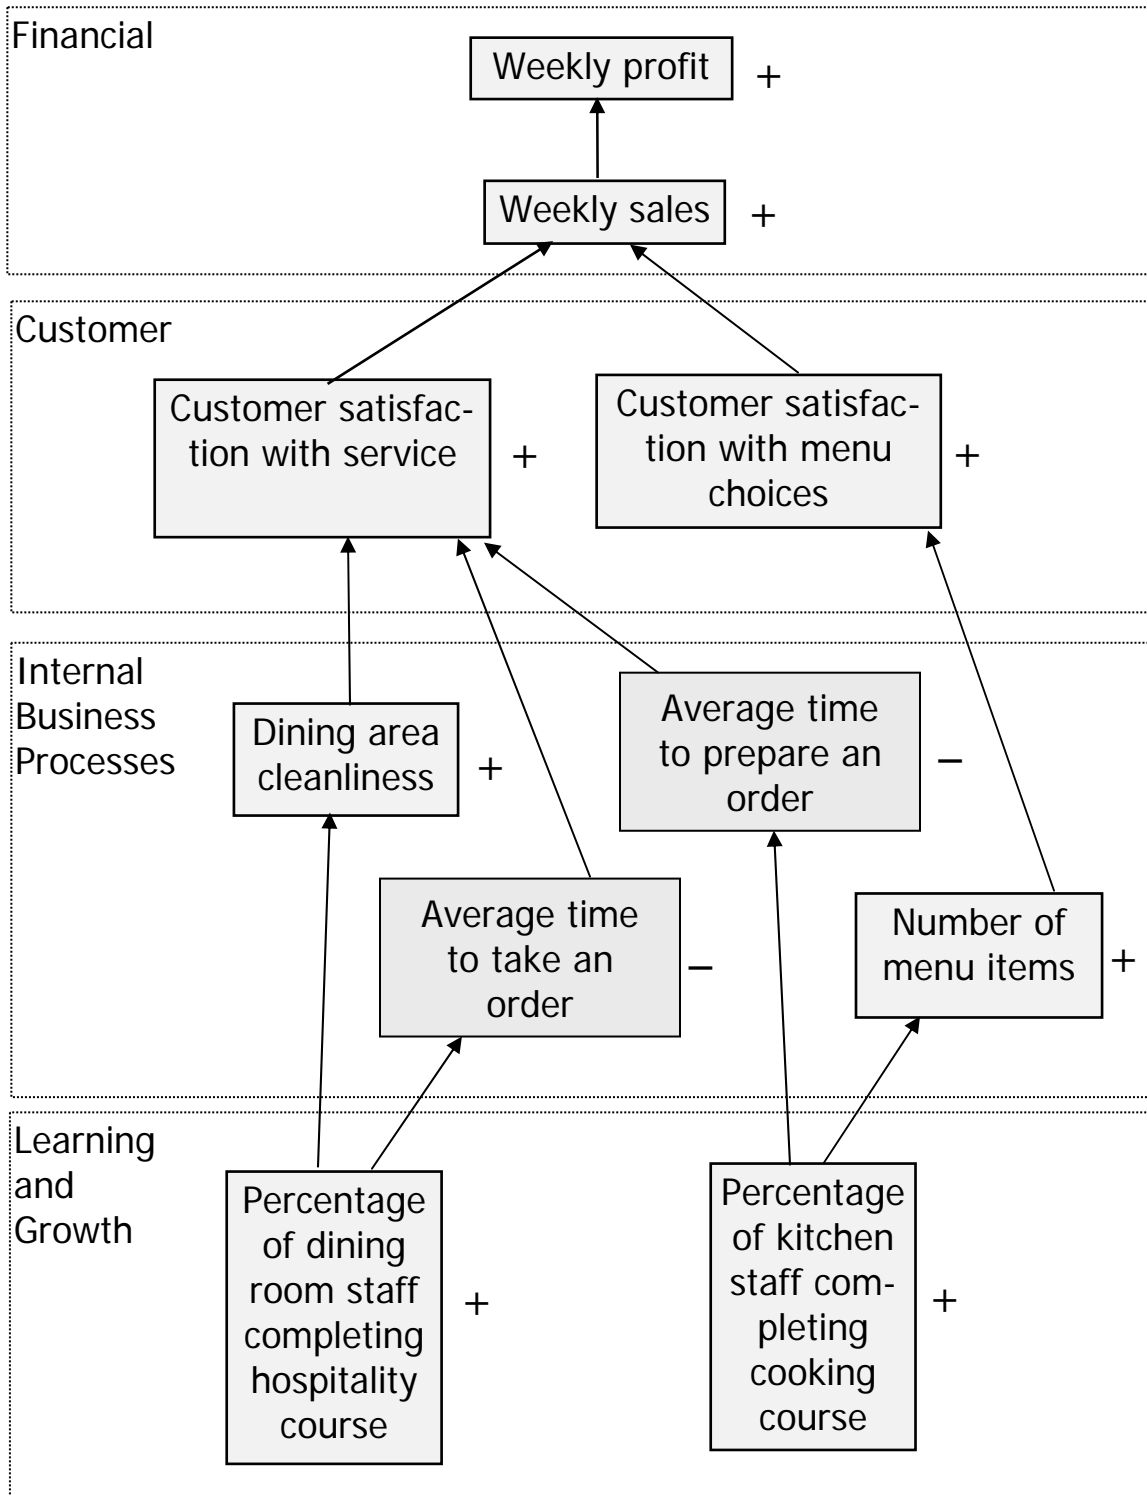

Note that the manufacturing cycle efficiency has improved dramatically over the last three months. This means that non-value-added time is being eliminated.

5. Under JIT the goal of the company is to produce to meet demand rather than to just fill labor time. Thus, the traditional labor variances are often unfavorable. Throughput time and MCE focus on *all* elements of manufacturing—not just labor time. These other elements, which are independent of labor time, are showing greater efficiency each month as the company eliminates non-value-added activities.

Throughput time and MCE are more appropriate in this situation since they focus on those elements that are of greatest importance in a JIT environment. The labor efficiency variance has little or no significance in such an environment.

**Problem 10-28** (45 minutes)

1. Students' answers may differ in some details from this solution.

## Problem 10-28 (continued)

2. The hypotheses underlying the balanced scorecard are indicated by the arrows in the diagram. Reading from the bottom of the balanced scorecard, the hypotheses are:
- o If the percentage of dining room staff who complete the basic hospitality course increases, then the average time to take an order will decrease.
  - o If the percentage of dining room staff who complete the basic hospitality course increases, then dining room cleanliness will improve.
  - o If the percentage of kitchen staff who complete the basic cooking course increases, then the average time to prepare an order will decrease.
  - o If the percentage of kitchen staff who complete the basic cooking course increases, then the number of menu items will increase.
  - o If the dining room cleanliness improves, then customer satisfaction with service will increase.
  - o If the average time to take an order decreases, then customer satisfaction with service will increase.
  - o If the average time to prepare an order decreases, then customer satisfaction with service will increase.
  - o If the number of menu items increases, then customer satisfaction with menu choices will increase.
  - o If customer satisfaction with service increases, weekly sales will increase.
  - o If customer satisfaction with menu choices increases, weekly sales will increase.
  - o If sales increase, weekly profits for the Lodge will increase.

Each of these hypotheses is questionable to some degree. For example, the items added to the menu may not appeal to customers. So even if the number of menu items increases, customer satisfaction with the menu choices may not increase. The fact that each of the hypotheses can be questioned does not, however, invalidate the balanced scorecard. If the scorecard is used correctly, management will be able to identify which, if any, of the hypotheses are incorrect. [See below.]

**Problem 10-28** (continued)

3. Management will be able to tell if a hypothesis is false if an improvement in a performance measure at the bottom of an arrow does not, in fact, lead to improvement in the performance measure at the tip of the arrow. For example, if the number of menu items is increased, but customer satisfaction with the menu choices does not increase, management will immediately know that something was wrong with that particular hypothesis.

### Problem 10-29 (45 minutes)

The answers below are not the only possible answers. Ingenious people can figure out many different ways of making performance look better even though it really isn't. This is one of the reasons for a *balanced scorecard*. By having a number of different measures that ultimately are linked to overall financial goals, "gaming" the system is more difficult.

1. Speed-to-market can be improved by taking on less ambitious projects. Instead of working on major product innovations that require a great deal of time and effort, R&D may choose to work on small, incremental improvements in existing products. There is also a danger that in the rush to push products out the door, the products will be inadequately tested and developed.
2. Performance measures that are ratios or percentages present special dangers. A ratio can be increased either by increasing the numerator or by decreasing the denominator. Usually, the intention is to increase the numerator in the ratio, but a manager may react by decreasing the denominator instead. In this case (which actually happened), the managers pulled telephones out of the high-crime areas. This eliminated the problem for the managers, but was not what the CEO or the city officials had intended. They wanted the phones fixed, not eliminated.
3. In real life, the production manager simply added several weeks to the delivery cycle time. In other words, instead of promising to deliver an order in four weeks, the manager promised to deliver in six weeks. This increase in delivery cycle time did not, of course, please customers and drove some business away, but it dramatically improved the percentage of orders delivered on time.

**Problem 10-29** (continued)

4. As stated above, ratios can be improved by changing either the numerator or the denominator. Managers who are under pressure to increase the revenue per employee may find it easier to eliminate employees than to increase revenues. Of course, eliminating employees may reduce total revenues and total profits, but the revenue per employee will increase as long as the percentage decline in revenues is less than the percentage cut in number of employees. Suppose, for example, that a manager is responsible for business units with a total of 1,000 employees, \$120 million in revenues, and profits of \$2 million. Further suppose that a manager can eliminate one of these business units that has 200 employees, revenues of \$10 million, and profits of \$1.2 million.

	<i>Before eliminating the business unit</i>	<i>After eliminating the business unit</i>
Total revenue .....	\$120,000,000	\$110,000,000
Total employees.....	1,000	800
Revenue per employee ...	\$120,000	\$137,500
Total profits.....	\$2,000,000	\$800,000

As these examples illustrate, performance measures should be selected with a great deal of care and managers should avoid placing too much emphasis on any one performance measure.

**Problem 10-30** (30 minutes)

1. a., b., and c.

	<i>Month</i>			
	<i>1</i>	<i>2</i>	<i>3</i>	<i>4</i>
Throughput time in days:				
Process time .....	2.1	2.0	1.9	1.8
Inspection time .....	0.8	0.7	0.7	0.7
Move time .....	0.3	0.4	0.4	0.5
Queue time during production.....	<u>2.8</u>	<u>4.4</u>	<u>6.0</u>	<u>7.0</u>
Total throughput time.....	<u>6.0</u>	<u>7.5</u>	<u>9.0</u>	<u>10.0</u>
Manufacturing cycle efficiency (MCE):				
Process time ÷ Throughput time .....	<u>35.0%</u>	<u>26.7%</u>	<u>21.1%</u>	<u>18.0%</u>
Delivery cycle time in days:				
Wait time to start of production.....	9.0	11.5	12.0	14.0
Throughput time .....	<u>6.0</u>	<u>7.5</u>	<u>9.0</u>	<u>10.0</u>
Total delivery cycle time.....	<u>15.0</u>	<u>19.0</u>	<u>21.0</u>	<u>24.0</u>

2. a. Areas where the company is improving:

*Quality control.* The number of defects has decreased by over 50% in the last four months. Moreover, both warranty claims and customer complaints are down sharply. In short, overall quality appears to have significantly improved.

*Material control.* The purchase order lead time is only half of what it was four months ago, which indicates that purchases are arriving in less time. This trend may be a result of the company's move toward JIT purchasing.

*Delivery performance.* The process time has decreased from 2.1 days to 1.8 days over the last four months.

**Problem 10-30** (continued)

b. Areas of deterioration:

*Material control.* Scrap as a percentage of total cost has tripled over the last four months.

*Machine performance.* Machine downtime has doubled over the last four months. This may be a result of the greater setup time, or it may just reflect efforts to get the new equipment operating properly. Also note that use of the machines as a percentage of availability is declining rapidly. The use of the machines may be declining as a consequence of the shift to JIT. Machines may be utilized less because they are not being used to build excess inventories.

*Delivery performance.* All delivery performance measures are moving in the wrong direction. Throughput time and delivery cycle time are both increasing, and the manufacturing cycle efficiency is decreasing.

3. a. and b.

	<i>Month</i>	
	<i>5</i>	<i>6</i>
Throughput time in days:		
Process time.....	1.8	1.8
Inspection time.....	0.7	0.0
Move time.....	0.5	0.5
Queue time during production.....	<u>0.0</u>	<u>0.0</u>
Total throughput time.....	<u>3.0</u>	<u>2.3</u>
Manufacturing cycle efficiency (MCE):		
Process time ÷ Throughput time.....	60.0%	78.3%

As non-value-added activities are eliminated, the manufacturing cycle efficiency improves. The goal, of course, is to have an efficiency of 100%. This is achieved when all non-value-added activities have been eliminated and process time equals throughput time.

**Problem 10-31** (45 minutes)

This problem is more difficult than it looks. Allow ample time for discussion.

<p>1. Actual Quantity of Input, at Actual Price (AQ × AP)</p> <hr style="border: 0.5px solid black;"/> <p style="text-align: center;">\$45,600</p>	<p>Actual Quantity of Input, at Standard Price (AQ × SP)</p> <hr style="border: 0.5px solid black;"/> <p style="text-align: center;">12,000 yards × \$4.00 per yard* = \$48,000</p>	<p>Standard Quantity Allowed for Output, at Standard Price (SQ × SP)</p> <hr style="border: 0.5px solid black;"/> <p style="text-align: center;">11,200 yards** × \$4.00 per yard* = \$44,800</p>
<div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;"> <p>↑</p> <p>Price Variance, \$2,400 F</p> </div> <div style="text-align: center;"> <p>↑</p> <p>Quantity Variance, \$3,200 U</p> </div> </div> <div style="border: 1px solid black; width: 100%; height: 30px; margin-top: 5px; text-align: center; padding: 5px;"> <p>Total Variance, \$800 U</p> </div>		

\* \$22.40 ÷ 5.6 yards = \$4.00 per yard

\*\* 2,000 sets × 5.6 yards per set = 11,200 yards

Alternative Solution:

Materials price variance = AQ (AP – SP)

12,000 yards (\$3.80 per yard\* – \$4.00 per yard) = \$2,400 F

\*\$45,600 ÷ 12,000 yards = \$3.80 per yard

Materials quantity variance = SP (AQ – SQ)

\$4.00 per yard (12,000 yards – 11,200 yards) = \$3,200 U

**Problem 10-31** (continued)

2. Many students will miss parts 2 and 3 because they will try to use *product* costs as if they were *hourly* costs. Pay particular attention to the computation of the standard direct labor time per unit and the standard direct labor rate per hour.

Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
\$18,200	2,800 hours × \$6.00 per hour* = \$16,800	3,000 hours** × \$6.00 per hour* = \$18,000
↑	↑	↑
<div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;">Rate Variance, \$1,400 U</div> <div style="text-align: center;">Efficiency Variance, \$1,200 F</div> </div>		
<div style="text-align: center;">Total Variance, \$200 U</div>		

\* 2,850 standard hours ÷ 1,900 sets = 1.5 standard hours per set,  
\$9.00 standard cost per set ÷ 1.5 standard hours per set =  
\$6.00 standard rate per hour.

\*\* 2,000 sets × 1.5 standard hours per set = 3,000 standard hours.

**Alternative Solution:**

Labor rate variance = AH (AR – SR)

2,800 hours (\$6.50 per hour\* – \$6.00 per hour) = \$1,400 U

\*\$18,200 ÷ 2,800 hours = \$6.50 per hour

Labor efficiency variance = SR (AH – SH)

\$6.00 per hour (2,800 hours – 3,000 hours) = \$1,200 F

**Problem 10-31** (continued)

3. Actual Hours of Input, at the Actual Rate (AH × AR)	Actual Hours of Input, at the Standard Rate (AH × SR)	Standard Hours Allowed for Output, at the Standard Rate (SH × SR)
\$7,000	2,800 hours × \$2.40 per hour* = \$6,720	3,000 hours × \$2.40 per hour* = \$7,200
↑	↑	↑
Spending Variance, \$280 U		Efficiency Variance, \$480 F
Total Variance, \$200 F		

\*\$3.60 standard cost per set ÷ 1.5 standard hours per set  
= \$2.40 standard rate per hour

Alternative Solution:

Variable overhead spending variance = AH (AR – SR)  
2,800 hours (\$2.50 per hour\* – \$2.40 per hour) = \$280 U

\*\$7,000 ÷ 2,800 hours = \$2.50 per hour

Variable overhead efficiency variance = SR (AH – SH)  
\$2.40 per hour (2,800 hours – 3,000 hours) = \$480 F

**Problem 10-32** (45 minutes)

1. Standard cost for a ten-gallon batch of raspberry sherbet.

Direct material:

Raspberries (7.5 quarts <sup>1</sup> × \$0.80 per quart) .....	\$6.00	
Other ingredients (10 gallons × \$0.45 per gallon) .....	<u>4.50</u>	\$10.50

Direct labor:

Sorting (18 minutes <sup>2</sup> ÷ 60 minutes per hour) × \$9.00 per hour .....	2.70	
Blending (12 minutes ÷ 60 minutes per hour) × \$9.00 per hour .....	<u>1.80</u>	4.50
Packing (40 quarts <sup>3</sup> × \$0.38 per quart) .....		<u>15.20</u>
Standard cost per ten-gallon batch .....		<u>\$30.20</u>

<sup>1</sup>6 quarts × (5 ÷ 4) = 7.5 quarts required to obtain 6 acceptable quarts.

<sup>2</sup>3 minutes per quart × 6 quarts.

<sup>3</sup>4 quarts per gallon × 10 gallons = 40 quarts.

2. a. In general, the purchasing manager is held responsible for unfavorable material price variances. Causes of these variances include the following:

- Incorrect standards.
- Failure to correctly forecast price increases.
- Purchasing in nonstandard or uneconomical lots.
- Failure to take available purchase discounts.
- Failure to control transportation costs.
- Purchasing from suppliers other than those offering the most favorable terms.

However, failure to meet price standards may be caused by a rush of orders or changes in production schedules. In this case, the responsibility for unfavorable material price variances should rest with the sales manager or the manager of production planning. Variances may also be caused by external events that are uncontrollable, e.g., a strike at a supplier's plant.

**Problem 10-32** (continued)

b. In general, the production manager or foreman is held responsible for unfavorable labor efficiency variances. Causes of these variances include the following:

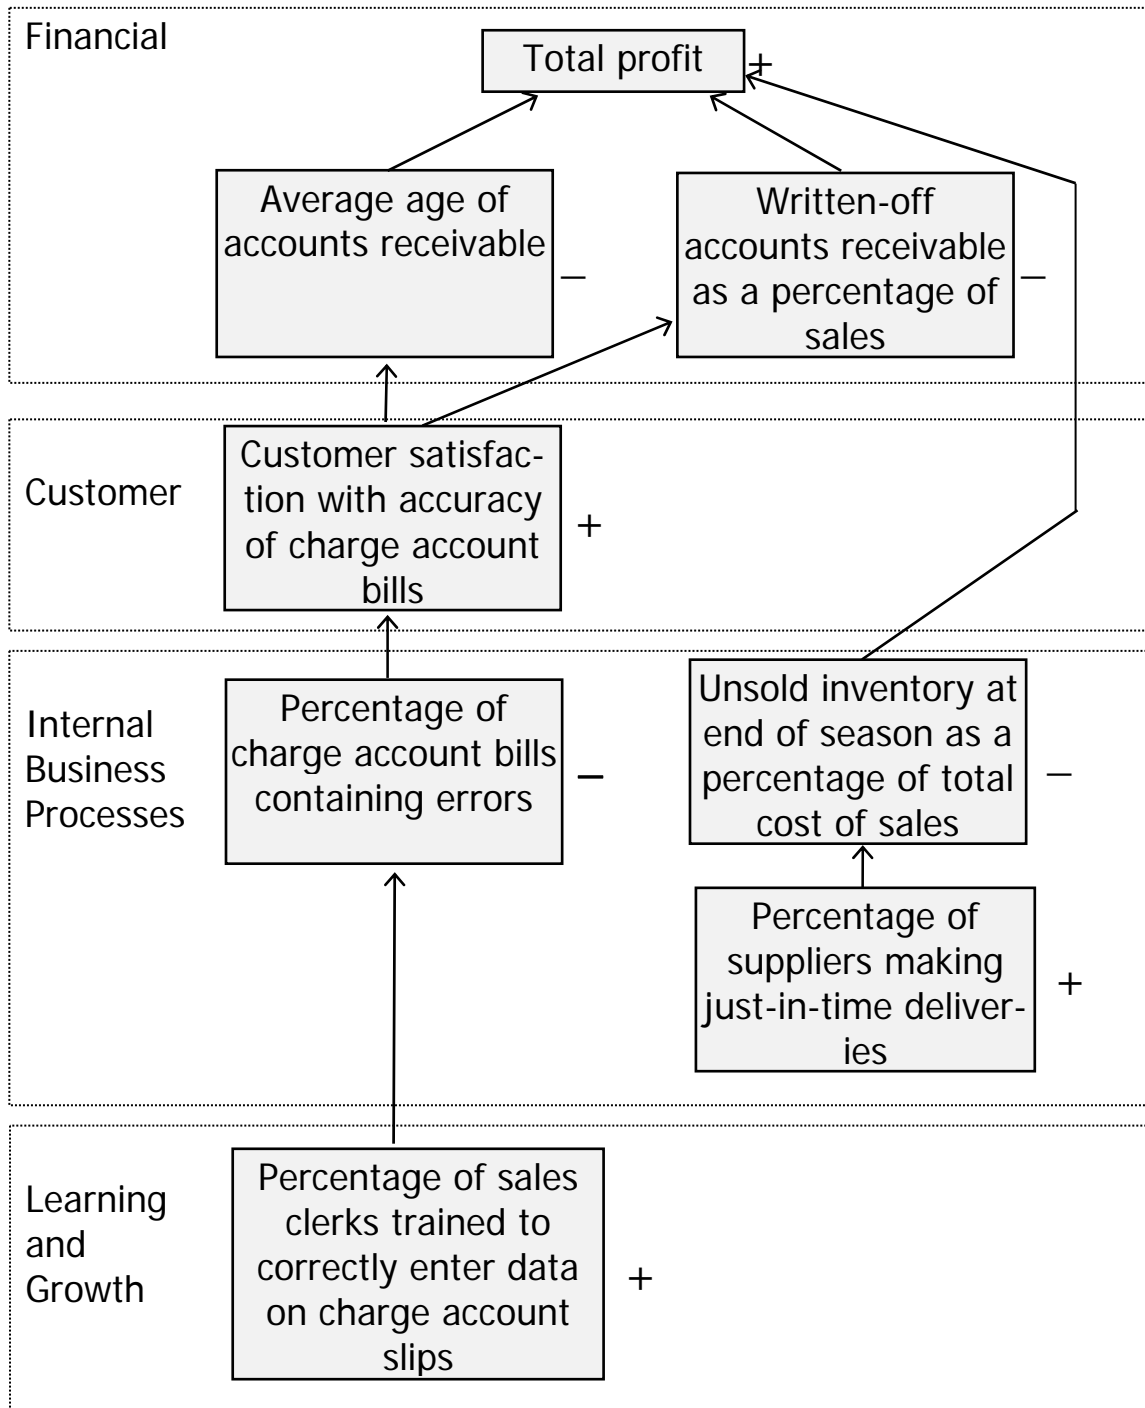

- Incorrect standards.
- Poorly trained labor.
- Substandard or inefficient equipment.
- Inadequate supervision.
- Machine breakdowns from poor maintenance.
- Poorly motivated employees.
- Fixed labor force with demand less than capacity.

Failure to meet labor efficiency standards may also be caused by the use of inferior materials or poor production planning. In these cases, responsibility should rest with the purchasing manager or the manager of production planning. Variances may also be caused by external events that are uncontrollable, e.g., low unemployment leading to the inability to hire and retain skilled workers.

(Unofficial CMA Solution, adapted)

**Case 10-33** (60 minutes)

1. Student answers may differ concerning which category—learning and growth, internal business processes, customers, or financial—a particular performance measure belongs to.

### Case 10-33 (continued)

A number of the performance measures suggested by managers have not been included in the above balanced scorecard. The excluded performance measures may have an impact on total profit, but they are not linked in any obvious way with the two key problems that have been identified by management—accounts receivables and unsold inventory. If every performance measure that potentially impacts profit is included in a company's balanced scorecard, it would become unwieldy and focus would be lost.

2. The results of operations can be exploited for information about the company's strategy. Each link in the balanced scorecard should be regarded as a hypothesis of the form "If ..., then ...". For example, the balanced scorecard on the previous page contains the hypothesis "If customers express greater satisfaction with the accuracy of their charge account bills, then the average age of accounts receivable will improve." If customers in fact do express greater satisfaction with the accuracy of their charge account bills, but the average age of accounts receivable does not improve, this would have to be considered evidence that is inconsistent with the hypothesis. Management should try to figure out why the average age of receivables has not improved. (See the answer below for possible explanations.) The answer may suggest a shift in strategy.

In general, the most important results are those that provide evidence inconsistent with the hypotheses embedded in the balanced scorecard. Such evidence suggests that the company's strategy needs to be reexamined.

### Case 10-33 (continued)

3. a. This evidence is inconsistent with two of the hypotheses underlying the balanced scorecard. The first of these hypotheses is "If customers express greater satisfaction with the accuracy of their charge account bills, then the average age of accounts receivable will improve." The second of these hypotheses is "If customers express greater satisfaction with the accuracy of their charge account bills, then there will be improvement in bad debts." There are a number of possible explanations. Two possibilities are that the company's collection efforts are ineffective and that the company's credit reviews are not working properly. In other words, the problem may not be incorrect charge account bills at all. The problem may be that the procedures for collecting overdue accounts are not working properly. Or, the problem may be that the procedures for reviewing credit card applications let through too many poor credit risks. If so, this would suggest that efforts should be shifted from reducing charge account billing errors to improving the internal business processes dealing with collections and credit screening. And in that case, the balanced scorecard should be modified.
- b. This evidence is inconsistent with three hypotheses. The first of these is "If the average age of receivables declines, then profits will increase." The second hypothesis is "If the written-off accounts receivable decrease as a percentage of sales, then profits will increase." The third hypothesis is "If unsold inventory at the end of the season as a percentage of cost of sales declines, then profits will increase." Again, there are a number of possible explanations for the lack of results consistent with the hypotheses. Managers may have decreased the average age of receivables by simply writing off old accounts earlier than was done previously. This would actually decrease reported profits in the short term. Bad debts as a percentage of sales could be decreased by drastically cutting back on extensions of credit to customers—perhaps even canceling some charge accounts. (Bad debts would be zero if there were no credit sales.) This would have the effect of reducing bad debts, but might irritate otherwise loyal credit customers and reduce sales and profits.

### Case 10-33 (continued)

The reduction in unsold inventories at the end of the season as a percentage of cost of sales could have occurred for a number of reasons that are not necessarily good for profits. For example, managers may have been too cautious about ordering goods to restock low inventories—creating stockouts and lost sales. Or, managers may have cut prices drastically on excess inventories in order to eliminate them before the end of the season. This may have reduced the willingness of customers to pay the store's normal prices. Or, managers may have gotten rid of excess inventories by selling them to discounters *before* the end of the season.

### Case 10-34 (30 minutes)

This case may be difficult for some students to grasp since it requires looking at standard costs from an entirely different perspective. In this case, standard costs have been inappropriately used as a means to manipulate reported earnings rather than as a way to control costs.

1. Lansing has evidently set very loose standards in which the standard prices and standard quantities are far too high. This guarantees that favorable variances will ordinarily result from operations. If the standard costs are set artificially high, the standard cost of goods sold will be artificially high and thus the division's net operating income will be depressed until the favorable variances are recognized. If Lansing saves the favorable variances, he can release just enough in the second and third quarters to show some improvement and then he can release all of the rest in the last quarter, creating the annual "Christmas present."
2. Lansing should not be permitted to continue this practice for several reasons. First, it distorts the quarterly earnings for both the division and the company. The distortions of the division's quarterly earnings are troubling because the manipulations may mask real signs of trouble. The distortions of the company's quarterly earnings are troubling because they may mislead external users of the financial statements. Second, Lansing should not be rewarded for manipulating earnings. This sets a moral tone in the company that is likely to lead to even deeper trouble. Indeed, the permissive attitude of top management toward the manipulation of earnings may indicate the existence of other, even more serious, ethical problems in the company. Third, a clear message should be sent to division managers like Lansing that their job is to manage their operations, not their earnings. If they keep on top of operations and manage well, the earnings should take care of themselves.

### Case 10-34 (continued)

3. Stacy Cummins does not have any easy alternatives available. She has already taken the problem to the President, who was not interested. If she goes around the President to the Board of Directors, she will be putting herself in a politically difficult position with little likelihood that it will do much good if, in fact, the Board of Directors already knows what is going on.

On the other hand, if she simply goes along, she will be violating the "Objectivity" standard of ethical conduct for management accountants. The Home Security Division's manipulation of quarterly earnings does distort the entire company's quarterly reports. And the Objectivity standard clearly stipulates that "management accountants have a responsibility to disclose fully all relevant information that could reasonably be expected to influence an intended user's understanding of the reports, comments, and recommendations presented." Apart from the ethical issue, there is also a very practical consideration. If Merced Home Products becomes embroiled in controversy concerning questionable accounting practices, Stacy Cummins will be viewed as a responsible party by outsiders and her career is likely to suffer dramatically and she may even face legal problems.

We would suggest that Ms. Cummins quietly bring the manipulation of earnings to the attention of the audit committee of the Board of Directors, carefully laying out in a non-confrontational manner the problems created by Lansing's practice of manipulating earnings. If the President and the Board of Directors are still not interested in dealing with the problem, she may reasonably conclude that the best alternative is to start looking for another job.

**Case 10-35 (90 minutes)**

This is a very rigorous case; be sure that students understand variances and journal entries before it is assigned.

1. Standard cost of Material A used in production (a) .....	\$5,760
Standard cost of Material A per batch	
(6 gallons × \$8.00 per gallon) (b) .....	<u>\$48</u>
Number of batches produced last week (a) ÷ (b) .....	<u>120</u>
2. a. Standard cost of last week's purchases	
(1,000 gallons × \$8.00 per gallon) .....	\$8,000
Deduct favorable price variance .....	<u>300</u>
Actual cost of last week's purchases .....	<u>\$7,700</u>

Alternative Solution:

$$\begin{aligned} \text{Materials price variance} &= (\text{AQ} \times \text{AP}) - (\text{AQ} \times \text{SP}) \\ (1,000 \text{ gallons} \times \text{AP}) - (1,000 \text{ gallons} \times \$8.00 \text{ per gallon}) &= \$300 \text{ F} \\ (1,000 \text{ gallons} \times \text{AP}) - \$8,000 &= -\$300^* \\ (1,000 \text{ gallons} \times \text{AP}) &= \$7,700 \end{aligned}$$

\*When used in the formula, a favorable variance is negative.

b. The number of gallons of Material A used in production can be computed through analysis of the raw materials inventory account:

Balance, Material A, 3/1 .....	\$ 0
Add purchases (1,000 gallons × \$8.00 per gallon) .....	<u>8,000</u>
Total Material A available .....	8,000
Less balance, Material A, 3/7 .....	<u>2,000</u>
Total Material A used (at standard cost) .....	<u>\$6,000</u>
Total cost of material A used	$\frac{\$6,000}{\$8.00 \text{ per gallon}} = 750 \text{ gallons used}$

**Case 10-35 (continued)**

- c. Materials quantity variance = SP (AQ – SQ)  
 \$8.00 per gallon (750 gallons – 720 gallons\*) = \$240 U  
 \*120 batches × 6 gallons per batch = 720 gallons

d. Raw materials (1,000 gallons × \$8.00 per gallon) .....	8,000
Materials price variance	
(1,000 gallons × \$0.30 per gallon F) .....	300
Accounts payable	
(1,000 gallons × \$7.70 per gallon*) .....	7,700
* $\$7,700 \div 1,000 \text{ gallons} = \$7.70 \text{ per gallon}$	

Work in process (720 gallons × \$8.00 per gallon) .....	5,760
Materials quantity variance	
(30 gallons U × \$8.00 per gallon) .....	240
Raw materials	
(750 gallons × \$8.00 per gallon) .....	6,000

3. a. The standard cost per pound of Material B can be computed by analyzing the raw materials inventory account:

Material B used in production .....	\$2,500
Add balance, Material B, 3/7 .....	<u>1,400</u>
Total Material B available last week .....	3,900
Deduct balance, Material B, 3/1 .....	<u>700</u>
Purchases of Material B (at standard cost) .....	<u><u>\$3,200</u></u>

$$\frac{\text{Purchases of Material B}}{\text{Number of pounds purchased}} = \frac{\$3,200}{800 \text{ lbs.}} = \$4.00 \text{ per pound}$$

- b. Material B drawn  
 from inventory .....
- |  |
|--|
| \$2,500 ÷ \$4.00/pound = 625 pounds used |
| Deduct unfavorable                       |
| quantity variance ... <u>100</u>         |
| Standard cost of                         |
| material used .....                      |
- \$2,400 ÷ \$4.00/pound = 600 pounds allowed

**Case 10-35 (continued)**

Alternative solution for standard quantity:

$$\begin{aligned} \text{Materials quantity variance} &= (\text{AQ} \times \text{SP}) - (\text{SQ} \times \text{SP}) \\ \$2,500 - (\text{SQ} \times \$4.00 \text{ per pound}) &= \$100 \text{ U} \\ \$2,500 - \$4 \text{ per pound} \times \text{SQ} &= \$100^* \\ \$4 \text{ per pound} \times \text{SQ} &= \$2,400 \\ \text{SQ} &= 600 \text{ pounds} \end{aligned}$$

\*When used with the formula, an unfavorable variance is positive.

c.  $600 \text{ pounds} \div 120 \text{ batches} = 5 \text{ pounds per batch}$

d. Total cost of purchases of materials

(accounts payable) .....	\$11,460
Less cost of Material A purchases (Part 2) .....	<u>7,700</u>
Cost of Material B purchases .....	<u>\$ 3,760</u>

Materials price variance =  $(\text{AQ} \times \text{AP}) - (\text{AQ} \times \text{SP})$

$$\begin{aligned} \$3,760 - (800 \text{ pounds} \times \$4.00 \text{ per pound}) &= \$3,760 - \$3,200 \\ &= \$560 \text{ U} \end{aligned}$$

e. Raw materials (800 pounds  $\times$  \$4.00 per pound) ..... 3,200

Materials price variance

(800 pounds  $\times$  \$0.70 per pound U) ..... 560

Accounts payable

(800 pounds  $\times$  \$4.70 per pound\*) ..... 3,760

\* $\$3,760 \div 800 \text{ pounds} = \$4.70 \text{ per pound}$

Work in process (600 pounds  $\times$  \$4.00 per pound) ..... 2,400

Materials quantity variance

(25 pounds U  $\times$  \$4.00 per pound) ..... 100

Raw materials (625 pounds  $\times$  \$4.00 per pound) .... 2,500

**Case 10-35 (continued)**

4. a. Labor rate variance = (AH × AR) – (AH × SR)  
 (\$4,100) – (400 hours\* × SR) = \$500 U  
 \$4,100 – 400 hours × SR = \$500\*\*  
 400 hours × SR = \$3,600  
 SR = \$9.00 per hour

\* 10 workers × 40 hours per worker = 400 hours

\*\* When used with the formula, an unfavorable variance is positive.

b. The standard hours per batch can be obtained by working through the standard cost card for Maxitol.

Standard cost per batch (given) .....	\$99.50
Less standard materials cost:	
Material A standard cost	
(6 gallons × \$8.00 per gallon) .....	\$48.00
Material B standard cost	
(5 pounds × \$4.00 per pound) .....	<u>20.00</u>
Direct labor standard cost per batch.....	<u>68.00</u>
	<u>\$31.50</u>
Direct labor standard cost per batch =	\$31.50 per batch
Standard rate per direct labor-hour =	\$9.00 per DLH
	= 3.5 DLHs per batch

c. 120 batches × 3.5 hours per batch = 420 hours

d. Labor efficiency variance = (AH × SR) – (SH × SR)  
 (400 hours × \$9.00 per hour) –  
 (420 hours × \$9.00 per hour) = \$180 F

e. Work in process (420 hours × \$9.00 per hour) ..... 3,780  
 Labor rate variance (400 hours × \$1.25 per hour U) ... 500  
 Labor efficiency variance  
 (20 hours F × \$9.00 per hour) ..... 180  
 Wages payable (400 hours × \$10.25 per hour\*) .... 4,100  
 \*\$4,100 ÷ 400 hours = \$10.25 per hour

**Case 10-35 (continued)**

5.	<i>Standard Quantity or Hours</i>	<i>Standard Price or Rate</i>	<i>Standard Cost</i>
Material A .....	6 gal.	\$8.00 per gallon	\$48.00
Material B .....	5 pounds	\$4.00 per pound	20.00
Direct labor .....	3.5 hours	\$9.00 per hour	<u>31.50</u>
Standard cost per batch .....			<u>\$99.50</u>

### Case 10-36 (30 minutes)

1. Based on the conversation between Terry Travers and Sally Christensen, it seems likely that their motivation would be stifled by the variance reporting system at Aurora Manufacturing Company. Their behavior may include any of the following:
  - Suboptimization, a condition in which individual managers disregard major company goals and focus their attention solely on their own division's activities.
  - Frustration from untimely reports and formats that are not useful in their daily activities.
  
2. a. The benefits that can be derived by both the company and its employees from a properly implemented variance reporting system include the following:
  - Variance analysis can provide standards and measures for incentive and performance evaluation programs.
  - Variance reporting can emphasize teamwork and interdepartmental dependence.
  - Timely reporting provides useful feedback, helps to identify problems, and aids in solving these problems. Responsibility can be assigned for the resolution of problems.
  
- b. Aurora Manufacturing Company could improve its variance reporting system, so as to increase employee motivation, by implementing the following:
  - Introduce a flexible budgeting system that relates actual expenditures to actual levels of production on a monthly basis. In addition, the budgeting process should be participative rather than imposed.
  - Only those costs that are controllable by managers should be included in the variance analysis.
  - Distribute reports on a timelier basis to allow quick resolution of problems.
  - Reports should be stated in terms that are most understandable to the users, i.e., units of output, hours, etc.

## **Group Exercise 10-37**

The answers to the questions in this group exercise will depend on the particular auto repair company that is investigated.

## **Group Exercise 10-38**

The answers to the questions in this group exercise will depend on the particular company that is investigated.
